Question #1 *Topic 1*

HOTSPOT -

The owner of a company needs to know who signs into the system.

You need to ensure that the owner can view the user audit logs.

Where does each action need to be performed? To answer, select the appropriate options in the answer area.

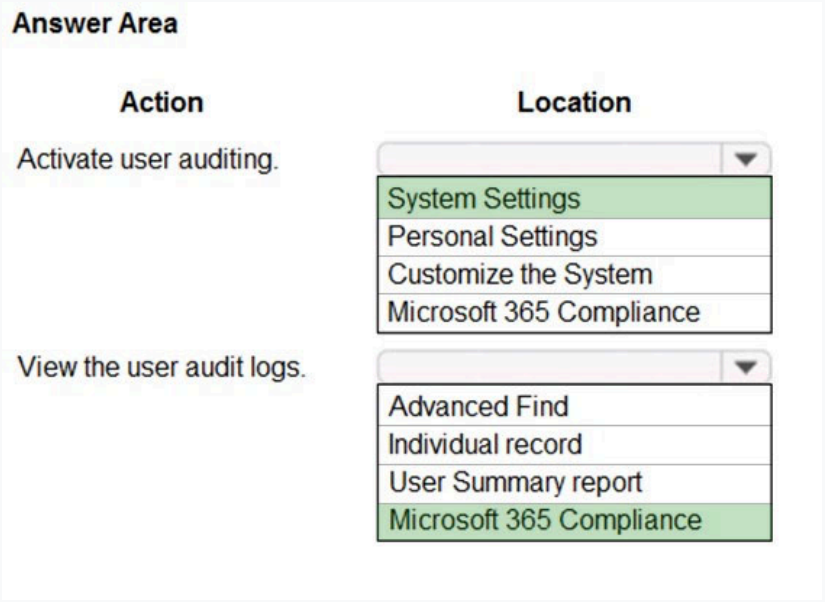
NOTE: Each correct selection is worth one point.

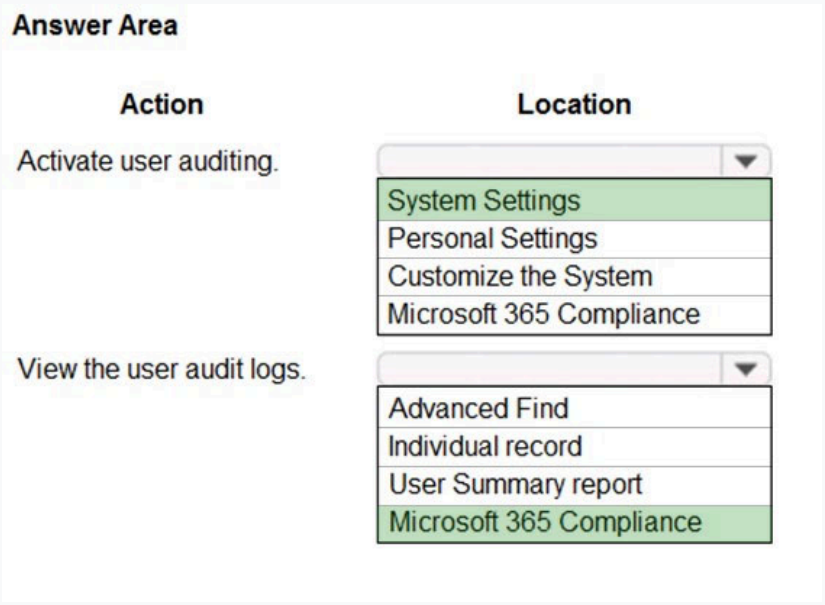
Hot Area:

Answer Area

Action	Location
Activate user auditing.	System Settings Personal Settings Customize the System Microsoft 365 Compliance
View the user audit logs.	Advanced Find Individual record User Summary report Microsoft 365 Compliance

Suggested Answer:





Reference: https://docs.microsoft.com/en-us/power-platform/admin/audit-data-user-activity

bcav Highly Voted 1 year, 11 months ago

Answer is correct - https://docs.microsoft.com/en-us/power-platform/admin/logging-powerapps

upvoted 56 times

avow Highly Voted 1 year, 11 months ago

This is a sneaky question to try and catch old school people off guard. The old way of doing this was both under System Settings > Auditing. You still have to turn on Auditing from here (for now) but they want to to consume the data from the new Compliance area.

upvoted 14 times

6df7e5b Most Recent 1 year ago

Worth Noting: Choice 2 – User Summary Report – is often seen as a distractor. In Power Platform Admin Centre under Environment > Settings > Auditing, what you actually get is the Audit Summary View, which does show who accessed what and when. However, the 'User Summary Report' is not a real feature in the platform — it's not found in PPAC and doesn't give relevant audit details. So even though 'Audit Summary View' would be correct functionally, it's not listed as an answer option. If 'User Summary Report' is listed, it's likely a trap — don't pick it. As Allesglar also mentioned below. Correct answer: System Settings and Compliance Centre now known as Purview.

upvoted 2 times

MVPConsultant 2 years, 3 months ago

Hmm you can activate user auditing in admin.powerplatform - select environment - audit logs - auditing settings - then tick start auditing. but the options dont seem to match maybe because this is an old question.

View the user audit logs should be 'audit summary view' you can go to audit summary view in system settings but also from the admin area

upvoted 1 times

MVPConsultant 2 years, 3 months ago

Hmm you can activate user auditing in admin.powerplatform - select environment - audit logs - auditing settings - then tick start auditing. but the options dont seem to match maybe because this is an old question. View the user audit logs should be 'audit summary view' you can go to audit summary view in system settings but also from the admin areaThat is true. The answer needs an update. The Audit Setting is now within the Power Platform Settings then Audit Settings. To read the log, it is now in the Microsoft Purview. For the answer to this question, it is the closest that you could get, so System Settings and Microsoft 365.

upvoted 1 times

CookieMingkee 2 years, 2 months ago

That is true. The answer needs an update. The Audit Setting is now within the Power Platform Settings then Audit Settings. To read the log, it is now in the Microsoft Purview. For the answer to this question, it is the closest that you could get, so System Settings and Microsoft 365.

allesglar 3 years, 10 months ago

Answer is correct. Audit Summary view does not appear as possible answer.

upvoted 3 times

BrettusMaximus 4 years, 1 month ago

Viewing has changed. To View audit logging details - System administrators can see activity for the entities that are enabled for audit logging. Browse to the Power Platform admin center and sign in using administrator credentials. Go to Environments > [select an environment] > Settings > expand Audit and logs > Audit summary view.

upvoted 4 times

KrishEXM 4 years, 2 months ago

Office 365 Security & Compliance Center is being retired in the next few months. Features have already been migrated to new homes, so please update your bookmarks. Security features are available in the Microsoft 365 Defender portal Compliance features are available in the Microsoft Purview compliance portal Mail flow features are available in Exchange admin center The new portals include existing features and new, enhanced experiences for unified security, compliance, and mail flow management across Microsoft 365 services.

upvoted 2 times

jkaur 4 years, 5 months ago

Answers are correct.

upvoted 1 times

tmub47 4 years, 6 months ago

Interesting fact, Microsoft 365 Security and compliance (protection.office.com) has now been split into security (secuirty.microsoft.com) and compliance (compliance.microsoft.com). You will find the Audit log under security and it is just called Audit. Of course, you can still reach protection.office.com

upvoted 1 times

KorRaj 4 years, 9 months ago

When auditing in the Microsoft 365 compliance center is turned on, user and admin activity from your organization is recorded in the audit log and retained for 90 days. Since the question is "who sings into the system" and not admin centre. Also the questions is about Activate user auditing So i would go with "System Settings" and "Microsoft 365 Compliance", so answer provided is correct.

upvoted 5 times

Florent44 4 years, 10 months ago

The answer is false, the question is about user sign-in log and not about Power Platform specific log so we need to activate collect of audit log in Compliance Center and we can see them in the same place.

upvoted 1 times

rayl 5 years, 1 month ago

Microsoft 365 Security and Compliance Center (for both quesions) The dataverse documentation and the 365 documentation online both specifically call out using the 365 compliance center to setup and view Audit logs. https://docs.microsoft.com/en-gb/power-platform/admin/enable-use-comprehensive-auditing https://support.microsoft.com/en-us/topic/auditing-in-office-365-for-admins-9f6484d2-0fd2-17de-165f-c41346023906#:~:text=Sign%20into%20the%20Security%20%26%20Compliance%20Center%20with,you%20that%20the%20audit%20log%20is%20being%20prepared.In first link it is mentioned in paragraph Enable Auditing, that you must go to System Settings, https://docs.microsoft.com/en-gb/power-platform/admin/enable-use-comprehensive-auditing#enable-auditing

Question #2 *Topic 1*

Your organization does not permit the use of custom code for solutions.
You need to create a view that can be viewed by all users in an organization.
Where should you create the view?

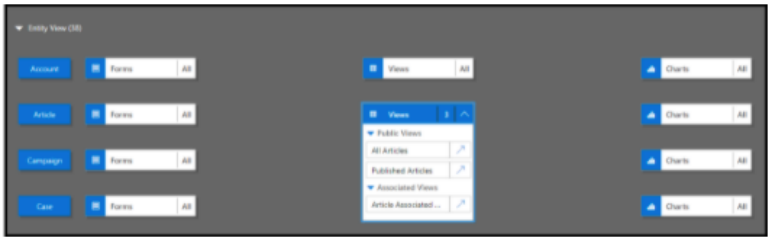
A. List view of the entity

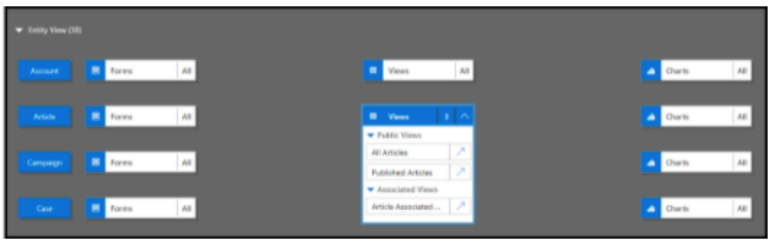
B. Microsoft Visual Studio

C. Templates area

D. Maker portal

Suggested Answer: *A*





Edit a public or system view in app designer You can change the way a public or system view is displayed by adding, configuring, or removing columns. 1. In the Views list for a table, select the Show list of references down arrow Drop Down. Edit View.

2. Next to the view you want to edit, select Open the View Designer Open view Designer. The view opens in the view designer. When you edit a public or system view, you must save and publish your changes before they will be visible in the application. Reference: https://docs.microsoft.com/en-us/powerapps/maker/model-driven-apps/create-edit-views-app-designer

D (59%) A (41%)

okanAT Highly Voted 2 years, 5 months ago

It has to be answer D because the current Microsoft PL-200 Course gives the answer that it can be createde by the Powerapps Maker Portal
https://learn.microsoft.com/en-us/training/modules/load-export-data-create-data-views/2-edit
upvoted 9 times

CookieMingkee Most Recent 1 year, 10 months ago

This is a tricky question because there are 2 plausible answers.

A is a possible answer but the exam is about Power Apps. This was the "old" way of creating views. It is old but the functionality is there.

D is a possible answer and suits the certification exam, being part of the Power Apps solution.

There are a lot of Microsoft certification exams that use word tricks instead of really testing your knowledge of the product. Unfortunately, there is no way of telling which is the "Microsoft Answer" unless you scored 100% and remember what answers you selected for each of those "trick" questions.

But for the answer, I'm selecting "A" because even in the Maker Portal, you still have to go to the "List of Views" in order to create the view.
upvoted 7 times

D is the modern way of doing this

upvoted 1 times

carlo_thedev 2 years, 4 months ago

A. List view of the entity Explanation: In a scenario where custom code is not permitted for solutions, the most appropriate option for creating a view that can be viewed by all users in an organization is within the list view of the entity itself.

upvoted 2 times

MrEz 2 years, 6 months ago

I would say D. but it says "Your organization does not permit the use of custom code for solutions." Wouldn't that change the solution XML. A change in the solution XML would be 'custom code' because it changes the 'code' of the XML. Any idea if and where Microsoft defines striclty and clearly what 'custom code' is? Is creating a BPF custom (in the solution) code? Is a Business Rue, sort of 'javascript' 'customcode'? or is custom 'code' anything you do in plugins?

upvoted 1 times

PL_TAROU 2 years, 7 months ago

Do I need to create a view that all users within the organization can see using the Maker portal? If it's for external users, the answer would be D, but…

upvoted 1 times

EsePe 2 years, 8 months ago

I think the answer is D. You create the public views on maker.powerapps.com at the sectio "Views" on the entity you want to create that view.

upvoted 4 times

MSDev23 3 years ago

Create or edit views You can create or edit views in two ways: Using the App Designer: If you're creating views for the first time, you may want to start with the App Designer, which provides a simple and intuitive UI with drag-and-drop capabilities. More information: Create and edit public or system views by using the app designer. Using the Solution Explorer: If you're already experienced with Dynamics 365 for Customer Engagement, you may want to use the Solution Explorer. More information: Create or edit a view.

upvoted 2 times

Cryptonix 3 years, 4 months ago

A is the correct answer. I am damn sure about that.

upvoted 2 times

shrikantkarpur 3 years, 4 months ago

Actually the question says without custom code

upvoted 1 times

Titto 3 years, 6 months ago

Option D, the Maker portal, is used to create custom solutions and automate business processes in an organization. However, since the organization does not permit the use of custom code, using the Maker portal would not be a suitable option.

upvoted 1 times

JD_onez 3 years, 10 months ago

This question is ambiguous as D is the modern way to do this.

upvoted 2 times

Joshua123123123 4 years, 9 months ago

I don't think this is correct, you wouldn't want to create a system view this way as it wouldn't be contained inside a solution (meaning you can't promote it to higher environments)!! I think D is a more appropriate answer

upvoted 2 times

Connor55 4 years, 10 months ago

This is NOT correct. The question asks where you would CREATE the view. You cannot create a view from the model app designer (the list view of the entity).Yes, you CAN create a view from the model driven app designer. There's an option above the list in the upper right corner.

upvoted 3 times

Connor55 4 years, 10 months ago

Yes, you CAN create a view from the model driven app designer. There's an option above the list in the upper right corner.

upvoted 11 times

Question #3 *Topic 1*

You create a Power Apps portal to provide training and documentation for students. Students create a profile on the portal and then select and pay for courses.
You plan to add free courses to the training portfolio. Free courses must be automatically available to all students after they sign in.
You need to assign default permissions to students.
What should you do?

A. Create a Students web role and set the Authenticated Users Role option to true. Assign the web role to each registered user.

B. Create an entity for managing free courses. Create entity permission records to provide access to entity records for free courses and assign the entity permissions to users when they register on the portal for the first time.

C. Create an entity for managing free courses. Create a Students web role and set the Authenticated Users role option to true. Create appropriate entity permissions to access the free course entity records and assign the entity permissions to the web role.

Suggested Answer: *A*
Official Answer: A

Community vote distribution
C (86%) A (14%)

ashlega Highly Voted 1 year, 11 months ago
It's probably C. "Authenticated Users role" does not need to be assigned, I believe (which is contrary to "A"). "B" is talking about assigning entity permissions to the users, which is incorrect since entity permissions are to be associated to the roles, and, then, the roles are to be assigned to the users. "C" seems to fit, though.
upvoted 62 times

ChristinaB Highly Voted 4 years, 9 months ago
The answer is A, if by no other reason than eliminating B and C. You do NOT want to create a custom entity to "free" courses. Free courses shouldn't be separated from other courses. All courses should be in the same entity with a flag to note them as free. Otherwise, you can end up with duplicate data in different tables leading to normalization issues.
upvoted 11 times

fu_chan Most Recent 1 year, 2 months ago
I think C is the best solution because A is inefficient.
upvoted 1 times

fobibulu 1 year, 10 months ago
The question states that free courses must be automatically available to all students after they sign in. It can't be A. Assign the web role to each registered user. <-How are you going to do this? It can't be B. Assign the entity permissions to users when they register on the portal for the first time. <-Again, how are you going to do this?
upvoted 4 times

Sebetha_M 2 years, 1 month ago
I think A is also correct, you can always create a web role and give it Authenticated users and assign it to a user when they first register on the portal using the cloud flow
upvoted 1 times

carlo_thedev 2 years, 4 months ago
CHAT GPT says it's C.
upvoted 2 times

WikyWik 2 years, 4 months ago
You can't assign a web role to a user, you can assign a user to a webrole. IMO.
upvoted 1 times

shrikantkarpur 3 years, 4 months ago
Its correct
upvoted 2 times

CalebXin 3 years, 4 months ago
A is wrong because no need to assign the role to each registered user.

upvoted 3 times

Radoslavov 3 years, 5 months ago

even dough i think is C, this is the official documentation for A: "By enabling the Authenticated Users Role, it will become the default web role for all users. This role is commonly used to provide a predetermined access for users that are not associated to any other roles. Keep in mind that users can have multiple web roles, but there can only be one Authenticated Users web role for authenticated users."

upvoted 2 times

fuddyduddy 3 years, 7 months ago

The question states that free courses must be automatically available to all students after they sign in. It can't be A. Assign the web role to each registered user. <-How are you going to do this? It can't be B. Assign the entity permissions to users when they register on the portal for the first time. <-Again, how are you going to do this? Which leaves C.

upvoted 2 times

Sean_K_Walsh 3 years, 7 months ago

It will seem like C is the answer. As the question suggests you are adding Free Courses to an existing solution. Which would also suggest the solution would already have assigned default web role for students to pay. Therefore it seems logical that a Free Course would not fit the current table permission actions. So custom entity seems logical. Badly worded question if they are testing your knowledge of default web roles.

upvoted 1 times

AlineVasarevic 3 years, 8 months ago

I was thinking about this one. You don't need to create an entity specific for free courses. If you already have a courses entity, you just need to add a column choice yes/no.

upvoted 2 times

AlineVasarevic 3 years, 9 months ago

The trick is "You need to assign default permissions to students." That why is A

HOTSPOT -

You create workflows to automate business processes.

You need to configure a workflow to meet the following requirements:

- ✑ Be triggered when a condition is met.
- ✑ Run immediately.
- ✑ Perform an action when a condition is met.

You need to create a workflow that automatically sends emails based on a mail merge template. To answer, select the appropriate configuration in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Workflow Requirement	Configuration Option
Be triggered when a condition is met.	Publish workflow. Subject contains data. Trigger when a Power Automate button is pressed.
Run immediately.	Approve the workflow. Configure the workflow to run now. Configure child workflow to run now.
Perform an action when a condition is met.	Send an email. View chart. Update a security role.

Suggested Answer:

Answer Area

Workflow Requirement	Configuration Option
Be triggered when a condition is met.	Publish workflow. **Subject contains data.** Trigger when a Power Automate button is pressed.
Run immediately.	Approve the workflow. **Configure the workflow to run now.** Configure child workflow to run now.
Perform an action when a condition is met.	**Send an email.** View chart. Update a security role.

Answer Area

Workflow Requirement	Configuration Option
Be triggered when a condition is met.	Publish workflow. **Subject contains data.** Trigger when a Power Automate button is pressed.
Run immediately.	Approve the workflow. **Configure the workflow to run now.** Configure child workflow to run now.
Perform an action when a condition is met.	**Send an email.** View chart. Update a security role.

BRIS776 Most Recent 1 year, 5 months ago

Here's the breakdown of the correct configurations: Workflow Requirement: Be triggered when a condition is met. Configuration Option: Subject contains data. * This implies a trigger based on the content of a subject line, indicating a condition being met. Workflow Requirement: Run immediately. Configuration Option: Configure the workflow to run now. This is the direct and obvious way to make a workflow execute instantly. Workflow Requirement: Perform an action when a condition is met. Configuration Option: Send an email. This is the specific action mentioned in the scenario (sending emails based on a mail merge template).

upvoted 3 times

shrikantkarpur 1 year, 10 months ago

yes the answers are correct

upvoted 1 times

abraham76 2 years ago

What does subject contain data means? what if the condition for a certain field is 'does not contain data', thenIt just means that a mail is recieved and that it might contain data. If that is true then trigger the flow.

Question #5 *Topic 1*

HOTSPOT -

You are a Dynamics 365 Customer Service administrator.

You need to configure the following automation for the sales team:

✑ Send an email when the status changes on an Opportunity.

✑ Text the sales manager when an Opportunity is created.

Create a Wunderlist task when an Opportunity is open for 30 days.

Which tool should you use for each requirement? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

.

Answer Area

Automation	Tool
Email when the status changes.	Dynamics 365 workflow / Microsoft Flow / Business Process Flow
Text when the Opportunity is created.	Dynamics 365 workflow / Microsoft Flow / Business Process Flow
Create a Wunderlist task.	Dynamics 365 workflow / Microsoft Flow / Business Process Flow

Suggested Answer:

Answer Area

Automation	Tool
Email when the status changes.	Dynamics 365 workflow
Text when the Opportunity is created.	Microsoft Flow
Create a Wunderlist task.	Microsoft Flow

Tool options: Dynamics 365 workflow / Microsoft Flow / Business Process Flow

Answer Area

Automation	Tool
Email when the status changes.	Dynamics 365 workflow
Text when the Opportunity is created.	Microsoft Flow
Create a Wunderlist task.	Microsoft Flow

Tool options: Dynamics 365 workflow / Microsoft Flow / Business Process Flow

Shogun Highly Voted 1 year, 11 months ago

Correct answers. Text and Wunderlist tasks could not be sent with a D365 workflow. Email could be sent with a D365 workflow.

upvoted 61 times

malyaban Highly Voted 1 year, 11 months ago

Let me clear this up because it was confusing to me. The first MUST be Dynamics 365 Flow because if you do it by Flow then it will trigger on every update of the record in a particular state but not on State Change. So it will send email e.g. on every update when the record is active but not only when the record state changes from Draft -> Active. This is a limitation of Power Automate. Please never select MS Flow for the first one.

upvoted 19 times

malyaban 1 year, 11 months ago

Let me clear this up because it was confusing to me. The first MUST be Dynamics 365 Flow because if you do it by Flow then it will trigger on every update of the record in a particular state but not on State Change. So it will send email e.g. on every update when the record is active but not only when the record state changes from Draft -> Active. This is a limitation of Power Automate. Please never select MS Flow for the first one.there are options to filter and to send the email when the condition is met. could you explain better?There are two things left, first there´s something call "Odata Filter" in power automate, which helps you filter data on your trigger, and another thing is that i think there is something a little bit tricky with states in power automate, try to change a state in the case entity to reloved with power automate and you realize that you can´t, and that to do it you have to use Dynamics 365 Workflows, i don´t really know if it happens with triggers en state resolved because i´v never tried but it happens when you want to update a record in state "resolved" so i hope it helps you.You can add a filter in the trigger, that prevents running in every update. Microsoft it's probably going to deprecate dynamics Workflows in the future so Power Automate must be the first option for every action you should perform in

Dynamics.That's not true, a Power Automate flow can be configured to only be triggered when changes happen on a specific column. Just enter the status column in the "Select column" field, and then the flow will only trigger upon status change.

upvoted 19 times

Heloizaleal1 5 years, 1 month ago

You can add a filter in the trigger, that prevents running in every update. Microsoft it's probably going to deprecate dynamics Workflows in the future so Power Automate must be the first option for every action you should perform in Dynamics.

upvoted 8 times

dlnuser 4 years, 2 months ago

That's not true, a Power Automate flow can be configured to only be triggered when changes happen on a specific column. Just enter the status column in the "Select column" field, and then the flow will only trigger upon status change.

upvoted 10 times

Challen 8 months, 3 weeks ago

To remember: internal CRM = workflow, external apps / SMS / SaaS = Flow, guided UI = BPF So: 1. Email on status change → Dynamics 365 workflow (internal CRM email automation) 2. Text when created → Microsoft Flow (external SMS service) 3. Wunderlist task after 30 days → Microsoft Flow (external app + timing)This is a great description, thank you.

upvoted 7 times

Here's the correct tool selection for each automation requirement: Email when the status changes on an Opportunity: Tool: Dynamics 365 workflow * Dynamics 365 workflows are ideal for automating actions within the Dynamics 365 environment based on specific triggers like status changes. Text the sales manager when an Opportunity is created: Tool: Microsoft Flow (now Power Automate) Power Automate is best suited for connecting to external services like SMS gateways or other communication platforms to send text messages. Create a Wunderlist task when an Opportunity is open for 30 days: Tool: Microsoft Flow (now Power Automate) Power Automate excels at integrating with various applications, including task management tools like Wunderlist (now Microsoft To Do, but the principle remains the same). It can also handle time-based triggers.

upvoted 2 times

figlionatonero 1 year, 5 months ago

Re discussion below about using Dynamics 365 Workflow (Classic Workflow) for sending emails, the reason why this is correct - despite being possible in Power Automate (MS Flow) as well - is because the Classic workflow supports executing it real-time (aka synchronous) whereas Power Automate works only in background. This is what I learned in the Udemy prep course

Question #6 *Topic 1*

A company uses Microsoft Dataverse to manage prospects. The company has a business process flow named BPFA that is associated with the Prospect entity to streamline the prospect management process.
You add a field named Category to the Prospect entity. You create additional business process flows. You apply the business process flows to Prospect records based on the selected category. Users can switch to any other newly configured business process flows but must not use BPFA.
You need to configure the solution.
What are two possible ways to achieve this goal? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. Remove all of the privileges for BPFA.

B. Use a business rule to prevent users from switching to BPFA.

C. Deactivate BPFA.

D. Change the display order of the business process flows to move BPFA to the bottom of the list.

Suggested Answer: *A, C*
Official Answer: AC

Seems correct.
upvoted 48 times

Ikhalil 1 year, 11 months ago
The two possible ways to achieve the goal are:

C. Deactivate BPFA: You can deactivate the BPFA business process flow associated with the Prospect entity so that it is no longer available for use. This can be done by going to the entity settings, selecting Business Process Flows, and then deactivating the BPFA flow. This will prevent users from selecting it and force them to choose from the newly configured business process flows.

D. Change the display order of the business process flows to move BPFA to the bottom of the list: You can change the display order of the business process flows so that the newly configured flows are displayed at the top and BPFA is moved to the bottom of the list. This will encourage users to select the newly configured flows first and make it less likely

D will do nothing, C will deactivate the solution but question does not mention its is obsolete.

upvoted 1 times

memh 1 year, 9 months ago

The two possible ways to achieve this goal are: C. Deactivate BPFA. Deactivating the BPFA will prevent users from using it. B. Use a business rule to prevent users from switching to BPFA. A business rule can be configured to check the selected category and prevent users from switching to BPFA. Let me explain why the other options are not suitable: A. Remove all of the privileges for BPFA. Removing privileges for BPFA would prevent users from accessing it altogether, including the ability to see it in the list of available business process flows. This is not the desired outcome, as users should still be able to see the BPFA but not use it. D. Change the display order of the business process flows to move BPFA to the bottom of the list. Changing the display order would not prevent users from switching to BPFA. Users could still scroll down and select it. By deactivating BPFA or using a business rule to prevent switching, you ensure that users can only access the newly configured business process flows based on the selected category.

upvoted 2 times

Miclarsen 1 year, 10 months ago

Is this really correct though? To prevent users from using BPFA in the Prospect entity, there seems to be two possible ways:

A. Remove all of the privileges for BPFA. By revoking the user's access to the BPFA business process flow, they will no longer be able to switch to it.

B. Use a business rule to prevent users from switching to BPFA. You can create a business rule that evaluates the Category field and prevents the selection of BPFA based on certain criteria.

Both options A and B will effectively prevent users from using BPFA, allowing you to apply the other business process flows based on the Category field.

upvoted 2 times

Question #7 *Topic 1*

You are creating a business rule to implement new business logic.
You must apply the business logic to a canvas app that has a single screen named Screen1.
You need to configure the scope for the business rule.
Which scope should you use?

A. Screen1

B. Entity

C. All Forms

D. Global

Suggested Answer: *B*
Note: Some terminology has changed. Entity is now Table. If you're building a Canvas app, you must use table (entity) as the scope. Reference: https://docs.microsoft.com/en-us/powerapps/maker/common-data-service/data-platform-create-business-rule

If a user is assigned the Dynamics 365 Service Admin role, then the user must be part of the security group before they are enabled in the environment. They can't access the environment until they are added to the security group and enabled. Environments support associating the following group types: Security and Microsoft 365. Associating other group types is not supported. in the link of the question I had read it, so I think it is group and group

upvoted 1 times

Smith_S 2 years, 2 months ago

Groups Access Rights

upvoted 1 times

wajid124 2 years, 11 months ago

I think at the MS365 admin level, it should be groups and at the sandbox env level it should be roles

upvoted 1 times

andy365 3 years, 1 month ago

You can prevent environment access with roles so Groups and Groups is correct.

upvoted 1 times

AmitKD 3 years, 8 months ago

It should be Managed roles because user will access the Environment from the model driven apps/ Canvas apps. if they don't have this things in the place then they can remove the user role, so that user will not able to access the Environment.

upvoted 1 times

bpaudel 3 years, 9 months ago

Groups and Groups is correct answer. Role should not be in the picture. https://learn.microsoft.com/en-us/power-platform/admin/control-user-access

upvoted 3 times

allesglar 3 years, 9 months ago

I believe the answer is correct. I do not understand why many suggest that there are not security groups for instances. All provided documentation here suggest otherwise.

upvoted 1 times

ShrikrishnaG 3 years, 11 months ago

The Answer should be (groups and groups) . Description Says ---------- If your company has multiple Microsoft Dynamics 365 Guides environments, you can use security groups to control which users can access each environment. A security group restricts access to the environment to people in the security group. If a Microsoft Dataverse environment does not have an associated security group, all users with a Dataverse license (Dynamics 365 Guides, Power Automate, Power Apps, and so on) will be created as users and enabled in the environment. Each environment can have just one security group. For example, you could create three security groups to control access to the following environments. https://learn.microsoft.com/en-us/dynamics365/mixed-reality/guides/admin-security

upvoted 3 times

Isjosh 4 years, 1 month ago

I think it should be Groups and Roles. what differentiate access to different environment in same tenant is either security group or roles. Security Groups are created in Office admin and can be use to restrict access once associated to environment. roles can be removed to users from in PPAC

upvoted 2 times

Austin_Loh 4 years, 1 month ago

Unsure if this question will be relevant anymore. Check https://docs.microsoft.com/en-us/power-platform/admin/control-user-access with a new information updated on the 22nd of June 2022. "New: Security groups cannot be assigned to default and developer environment types. If you've already assigned a security group to your default or developer environment, we recommend removing it since the default environment is intended to be shared with all users in the tenant and the developer environment is intended for use by only the owner of the environment." The sandbox environment should be inaccessible to normal users other than developers now.

upvoted 5 times

dlnuser 4 years, 3 months ago

The answer is correct. You can control the user access to a Dynamics environment with a security group configured in the Microsoft 365 admin center. Roles only control table-level permissions and app access, not environment access. https://docs.microsoft.com/en-us/power-platform/admin/control-user-accessThat's right but if you remove all security roles to a user within an instance, the users can't access, so that is working too. But as the questions is asked, it means that you should create a security group in Office 365 and assign users that can access the sandbox in in it and then assign the security group to the instance. So answer should be group/group but it is tricky question.I'd say it makes more sense to add users to a group than spend hours removing security roles from 500 users. Also, technically, the users if "Roles" would still have access to the sandbox, just not access to the data and the question asks about access to the environment. Groups would be the best way to handle it.

upvoted 3 times

dlnuser 4 years, 3 months ago

The answer is correct. You can control the user access to a Dynamics environment with a security group configured in the Microsoft 365 admin center. Roles only control table-level permissions and app access, not environment access. https://docs.microsoft.com/en-us/power-platform/admin/control-user-access

That's right but if you remove all security roles to a user within an instance, the users can't access, so that is working too. But as the questions is asked, it means that you should create a security group in Office 365 and assign users that can access the sandbox in in it and then assign the security group to the instance. So answer should be group/group but it is tricky question.

upvoted 2 times

ManuB 4 years, 2 months ago

That's right but if you remove all security roles to a user within an instance, the users can't access, so that is working too. But as the questions is asked, it means that you should create a security group in Office 365 and assign users that can access the sandbox in in it and then assign the security group to the instance. So answer should be group/group but it is tricky question.I'd say it makes more sense to add users to a group than spend hours removing security roles from 500 users. Also, technically, the users if "Roles" would still have access to the sandbox, just not access to the data and the question asks about access to the environment. Groups would be the best way to handle it.

Groups and Groups. The second is regarding to Security group attached to Dataverse environment. A user that is not a member to group A and is trying to access the Environment A what has Group A security group attached to this environment, this environment would not be showed to the systemuser. Are you confusing about that? Create a trial and follow this train of thought, seeing the doc https://docs.microsoft.com/en-us/power-platform/admin/control-user-access to check the concept used to this functionality.

Question #9 *Topic 1*

You must create a new entity to support a new feature for an app. Records for the entity must be associated with a business unit and specify security roles for the business unit.
You need to configure entity ownership.
Which entity ownership type should you use?

A. user or team owned

B. organization-owned

C. none

D. business-owned

Suggested Answer: *A*
Dataverse supports two types of record ownership. Organization owned, and User or Team owned. For security purposes, records that are organization owned, the only access level choices is either the user can do the operation or can't. For user and team owned records, the access level choices for most privileges are tiered Organization, Business Unit, Business Unit and Child Business Unit or only the user's own records. That means for read privilege on contact, I could set user owned, and the user would only see their own records. References: https://docs.microsoft.com/en-us/power-platform/admin/wp-security-cds

Question #10 *Topic 1*

HOTSPOT -

You need to ensure that there are no leads for a customer before you create a new opportunity for the customer.

How can you use duplicate detection rules to achieve this goal? To answer, select the appropriate options in the answer area.

NOTE:

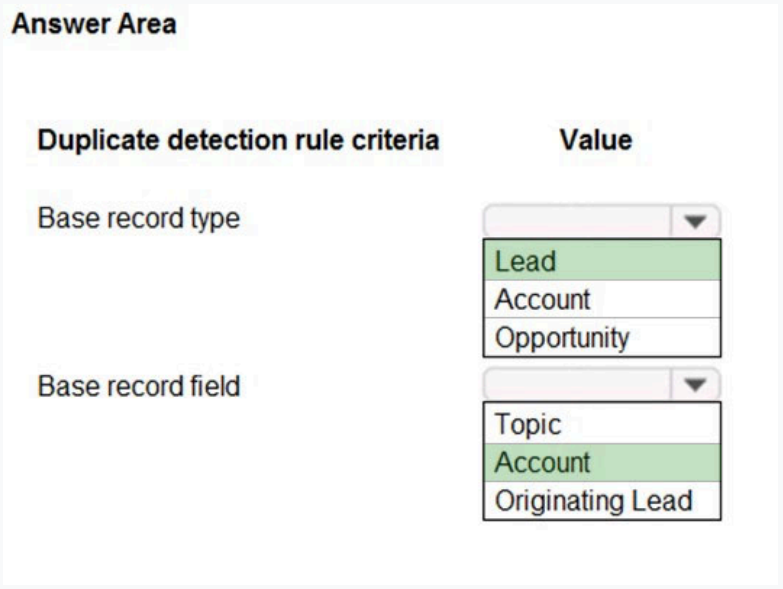
Each correct selection is worth one point.

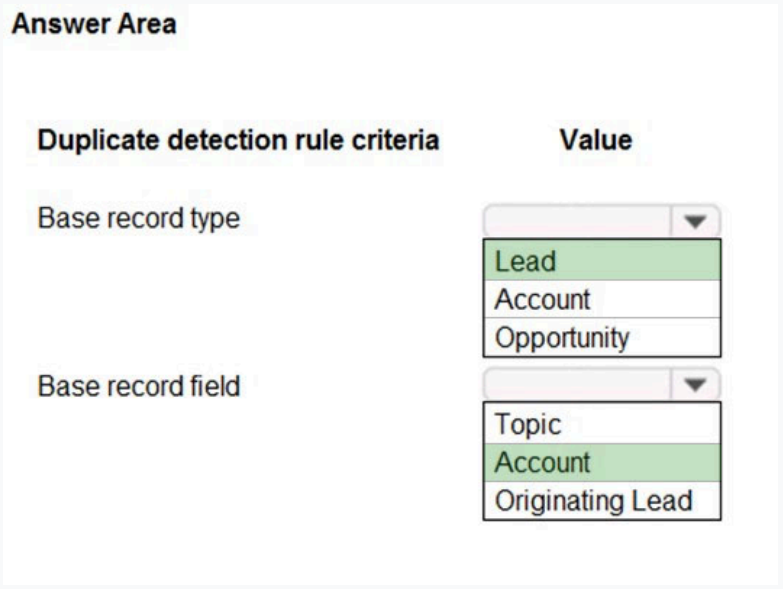
Hot Area:

Answer Area

Duplicate detection rule criteria	Value
Base record type	Lead / Account / Opportunity
Base record field	Topic / Account / Originating Lead

Suggested Answer:





ddu Highly Voted 1 year, 11 months ago

Duplicate detection on Lead will not trigger on Opportunity creation/update The rule must be created as follow - Base Record Type: Opportunity - Matching Record Type: Lead - Base Record field: Account - Matching Record field: Parent Account for Lead (or another if you use a different one) - Criteria: Exact Match So answer is Opportunity - Account@ddu you are correct. There is no Account field in Lead. So just for elimination needs to be Opportunity - Account. If we select Lead in the first item, then the second item should be "Parent Account" which is not an optionWhen creating a lead, there is an option to set the Account column. An existing account can have multiple leads.The lead and the opps are tied to an account.

upvoted 123 times

ddu Highly Voted 1 year, 11 months ago

Duplicate detection on Lead will not trigger on Opportunity creation/update

The rule must be created as follow - Base Record Type: Opportunity - Matching Record Type: Lead - Base Record field: Account - Matching Record field: Parent Account for Lead (or another if you use a different one) - Criteria: Exact Match

So answer is Opportunity - Account

BRIS776 Most Recent 1 year, 5 months ago

Duplicate detection rule criteria: Base record type Value: Opportunity We want to prevent the creation of a new Opportunity if there are existing Leads for the same customer. Therefore, the base record type is Opportunity. Duplicate detection rule criteria: Base record field Value: Account We need to check if the Account associated with the new Opportunity already has existing Leads. The Account field is the common link between Opportunities and Leads.

upvoted 1 times

NOURD123 1 year, 9 months ago

Base Record Type: Opportunity This ensures that when an opportunity is being created, the system checks for existing leads for the customer. Base Record Field: Account This field specifies that the rule should look at the customer (Account) to identify duplicates. By matching the Account, the rule can check if there are any existing leads for the same customer before allowing the creation of the new opportunity.

upvoted 3 times

avow 1 year, 10 months ago

You have to break this question down to understand what is being asked. "You need to ensure that there are no leads for a customer before you create a new opportunity for the customer." This means you are manually creating an Opportunity and want to check back to see if there are any Leads prior to doing so. This has nothing to do with converting a Lead to an Opportunity. When they say "customer" what does that mean in Microsoft words? It means Account. So you need to ensure when an Opportunity is created that there is no Leads associated to the matching Account.Yes but duplicate detection on creation of Opportunity will only check for data on other Opportunity records. When creating Opportunity, it will not check Leads, unless Lead is a field on the Opportunity..

upvoted 19 times

avow 1 year, 10 months ago

upvoted 1 times

rokyetti 1 year, 10 months ago

ddu has the right solution and I just tested it. The base entity or table needs to be the one that triggers is. You are trying to create an opportunity so it has to be opportunity. What the solution does is compare the account on the opportunity to the accounts on the leads, if any of the active leads have the same account, then the rule is triggered.

upvoted 10 times

Principle 1 year, 10 months ago

The customer engagement apps (Dynamics 365 Sales, Dynamics 365 Customer Service, Dynamics 365 Field Service, Dynamics 365 Marketing, and Dynamics 365 Project Service Automation), include default duplicate detection rules for accounts, contacts, and leads, but not for other types of records. So the answer for 1st question shall be Lead, does that make sense?

upvoted 2 times

sinjan 1 year, 10 months ago

Let's go over the definitions first in Data Management > duplicate detection rules Base record type: record type of the record being evaluated for potential duplicates. Matching record type: record type of the record being evaluated as potential duplicate. Which entity is being evaluated for potential duplicate? Lead. Which entity is being evaluated as a potential duplicate ? Opportunity Which field of the record is being evaluated for duplicate? account (i.e. base record field and matching record field)

upvoted 4 times

Smith_S 2 years, 2 months ago

when creating a new opportunity, the system checks for any existing leads related to the same customer (originating lead) and prevents the creation of the opportunity if a lead already exists. The answer is: Opportunity - Originating lead

upvoted 2 times

sylwiaszymanska88 2 years, 11 months ago

"The Merge option is available only for Account, Lead, and Contact entities. The Merge option will only be enabled if a duplicate record of the same table is selected. Merging duplicate records from different tables is not supported." - correct answer Lead-Account

Correct
upvoted 23 times

inscho Highly Voted 3 years, 2 months ago
B. Add salespeople to a security role. - By adding salespeople to a specific security role within the sales company environment, you can control their access and permissions within that environment. The security role defines the privileges and restrictions that users have in terms of accessing and manipulating data and functionality within the environment. Adding salespeople to a security role ensures that they have the necessary permissions to perform their job functions within the sales company environment while maintaining the separation and isolation between the two environments, preventing users from one environment from seeing the other.

Option A - Adding salespeople to an Office 365 security group - may be useful for managing access to other Office 365 resources but is not specifically tied to controlling access within the Power Platform environments.

A is the answer. A. Add salespeople to an Office 365 security group. (For Environment Access) B. Add salespeople to a security role. (Dataverse Access) You can create Office 365 security groups, add users to them, and grant access to the environment. In the environment, in Dataverse, you can create a team, link a Dataverse team to an Office 365 group, and assign a security role to the Dataverse team to set privileges for the team within Dataverse. The answer remains A.
upvoted 2 times

carterbarry88 1 year, 1 month ago

By default ALL users have access to ALL power platform environments if they have a valid license. In order to limit access to environments, you need to setup security groups and associate them to an environment. Once an environment has been locked down to a specific security group, then users need to be added to the security group in order to be granted access to the environment. Step order: 1) Create new security group 2) Associate security group to environment 3) Add users to security group. Which is why the answer is A.

upvoted 1 times

Akin_Eren 1 year, 2 months ago

For the environment settings, first security group assignment should be done.

upvoted 1 times

Abdullah7 1 year, 11 months ago

Option A. is not the correct approach in this scenario because Office 365 security groups control access to resources at the broader Office 365 level (like SharePoint sites, Teams, or mailboxes) and do not directly manage access within specific Power Platform environments or apps.

upvoted 2 times

5f14337 2 years, 1 month ago

B. Add salespeople to a security role Security roles in Power Platform define what actions a user can perform and what data they can interact with. By adding the salespeople to a security role that has access to the sales company environment, you can ensure they have the necessary permissions. This method also ensures that users in one environment cannot see the other environment, as security roles are specific to the environment they are created in. Office 365 security groups (Option A) can be used to manage user access at a higher level, they are not environment-specific. Options C and D involve setting privileges and app security, which are components of a security role, but do not directly add users to an environment. Therefore, these options might not fully meet the requirements.

upvoted 2 times

Smith_S 2 years, 2 months ago

Add salespeople to a security role.

upvoted 2 times

itenginerd 2 years, 3 months ago

My read on this one is that once a user is in the environment, you can add them to a security role--but just adding a group of users to a security role does not prevent OTHER users from seeing the environment. Adding users to a security group and assigning it to the environment, however, does. From the cited doc: When a security group is associated with an existing environment with users, all users in the environment that are not members of the group will be disabled. The way I read it, adding users to the M365 group DOES immediately prevent anyone who's not in that group from seeing the environment, which is the core goal of the question.

Question #12 *Topic 1*

A veterinary office plans to use Power Platform to streamline customer experiences. The customer creates a canvas apps to manage appointments.
On the client appointment form, there is a dropdown field for clients to select their type of pet. If a client selects the option Other, the veterinarian wants a text field to appear so that additional details can be added.
You need to create a dynamically visible field.
What should you configure?

A. workflow

B. business process flow

C. business rule

Suggested Answer: *C*
By combining conditions and actions, you can do any of the following with business rules:

Set column values -

Clear column values -

Set column requirement levels -

Show or hide columns -

Enable or disable columns - Validate data and show error messages Create business recommendations based on business intelligence.

All are wrong, but the most logical one is C

upvoted 1 times

BRIS776 1 year, 5 months ago

The correct answer is C. business rule. Here's why: Conditional Visibility: Business rules in canvas apps are designed to handle conditional logic and actions based on user input. In this case, you want the text field to become visible only when the "Other" option is selected in the dropdown. This is a classic use case for a business rule's "Show/Hide" action.

In the context of Power Platform and canvas apps, business rules allow you to set field visibility logic without writing code. You can create a business rule that checks the value of the dropdown field, and if the selected value is "Other," the business rule can then set the visibility property of the text field to true, making it appear for the client to enter additional details. Here's a simplified view of the steps you might follow: Open the table where the appointment data is stored in Power Apps. Navigate to the "Business Rules" section for that table. Create a new Business Rule. Set the condition to check if the "Type of Pet" field value equals "Other". If the condition is true, set the action to show the additional details text field. Save and activate the Business Rule.

Question #13 *Topic 1*

You create an app for the sales team at a company.
Members of the sales team cannot access the app.
You need to ensure that sales team members can access the app.
Where should you configure app permissions?

A. Dynamics administration center

B. Manage Roles

C. Security Roles

Suggested Answer: *B*
Manage access to apps by using security roles. You can choose what users see and access from the My Apps page or the Customer Engagement home page by giving app access to specific security roles. Users will have access to apps based on the security roles they're assigned to. 1. Go to Settings > My Apps. 2. In the lower-right corner of the app tile you want to manage access for, select More options (...), and then select Manage Roles. 3. Enter the following in the Manage Roles dialog box: a) App URL Suffix b) Roles c) Select Save. 4. Refresh the My Apps page. 5. Go to the Apps Being Edited view, and publish the app again. B - Manage roles is correct. The question is where to configure APP permissions, this is done at the app level, through the "Manage Roles" option in the legacy interface, or the "Share" menu in the modern interface.
upvoted 4 times

nessus 1 year, 3 months ago
You can create security role, but this controls data and entity access but not direct app visibility. You still need to assign those roles to the app using "Manage Roles" from 3 dots on app icon.
upvoted 1 times

elka88 1 year, 5 months ago
App -> Three dots -> Manage roles
upvoted 2 times

DoubleO7 1 year, 6 months ago
Correct answer is C. When you share model driven app it specifically says: Add people and assign security roles so that they can use your app.
upvoted 2 times

victorv587 1 year, 6 months ago
Where should you configure app permissions? notice Where and app
upvoted 1 times

RaviA 1 year, 10 months ago

This is tricky question B is correct because Question say what you will configure You cannot configure Security roles for specific app.

upvoted 2 times

Skiis 1 year, 12 months ago

I think its Manage Roles. When you share an app, there will be an option that says 'Manage Security Roles', where you can select which security roles the app will use. So I say B. I thought it was C until I tried to share an app and saw that manage security roles is possible. Also it says 'WHERE' to configure not 'WHAT' to configure. For example the question above asks 'WHAT' and this says 'WHERE'

To ensure that sales team members can access the app, you should configure app permissions in the Dynamics administration center. Option A, "Dynamics administration center," is the correct choice. In Dynamics 365 or a similar CRM system, the Dynamics administration center is typically where you control user access and permissions to various apps and features. You can assign users to roles, configure security settings, and manage overall access to specific applications. Option B, "Manage Roles," and Option C, "Security Roles," are important components within the Dynamics administration center. "Manage Roles" is where you create custom roles to define what actions users can perform in the app, and "Security Roles" are used to grant or restrict access to specific records and entities within the system. However, configuring app permissions typically begins at the broader level in the Dynamics administration center before fine-tuning access at the role and security role levels.

upvoted 3 times

drjphat 2 years, 10 months ago

Power Apps Admin Center > Environments > [Select Env] > Settings> Users + Permissions > SECURITY ROLES. There is no "Manage Roles" section. It's Security Roles. Am I missing something?

upvoted 6 times

Question #14 *Topic 1*

You create a parent entity and a child entity. The parent entity has a 1:N relationship with the child entity.
You need to ensure that when the owner changes on the parent record that all child records are assigned to the new owner.
You need to configure the relationship behavior type.
What should you use?

A. Referential

B. Referential, Restrict Delete

C. Parental

D. Restrict

Suggested Answer: *C*

Action	Parental	Not Parental
Assign	Cascade All Cascade User-owned Cascade Active	Cascade None
Delete	Cascade All	RemoveLink Restrict
Reparent	Cascade All Cascade User-owned Cascade Active	Cascade None
Share	Cascade All Cascade User-owned Cascade Active	Cascade None
Unshare	Cascade All Cascade User-owned Cascade Active	Cascade None

Action	Parental	Not Parental
Assign	Cascade All Cascade User-owned Cascade Active	Cascade None
Delete	Cascade All	RemoveLink Restrict
Reparent	Cascade All Cascade User-owned Cascade Active	Cascade None
Share	Cascade All Cascade User-owned Cascade Active	Cascade None
Unshare	Cascade All Cascade User-owned Cascade Active	Cascade None

A parental table relationship is any 1:N table relationship where one of the cascading options in the Parental column of the following table is true.

DRAG DROP -

You need to recommend a role for users to perform several required tasks. The solution must use the principle of least privilege.

Which roles should you recommend? To answer, drag the appropriate roles to the correct functions. Each role may be used once, more than once, or not at all.

You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Select and Place:

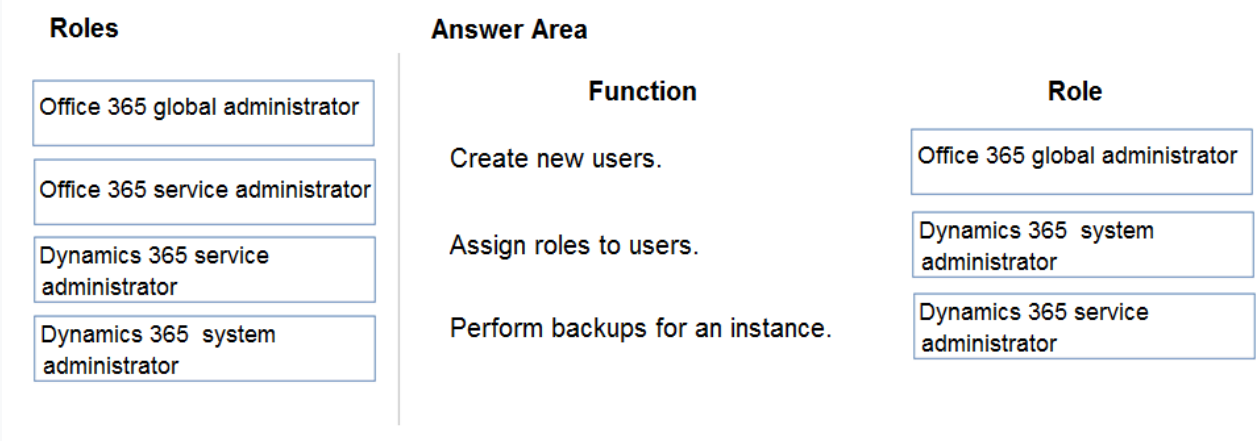
Roles

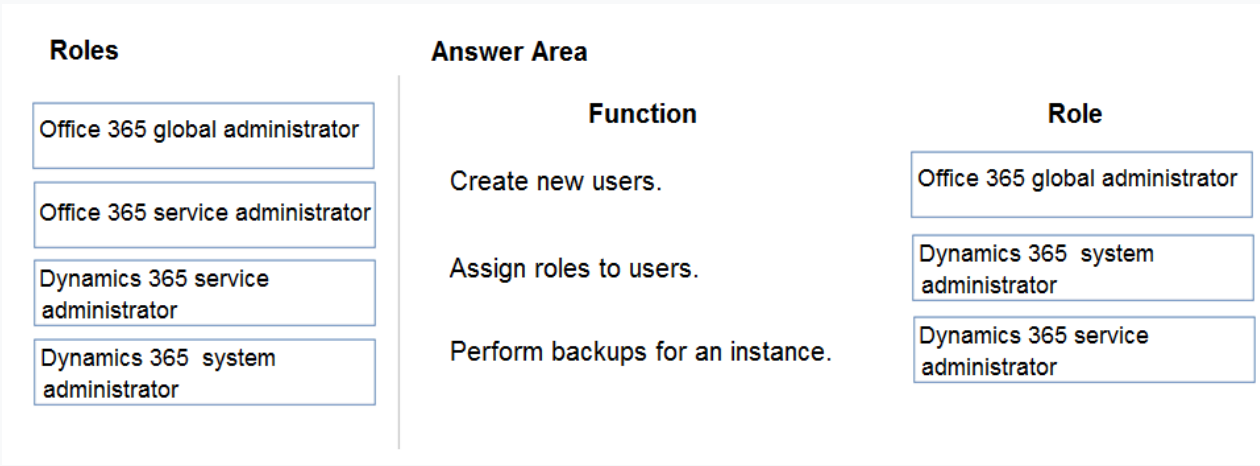
- Office 365 global administrator
- Office 365 service administrator
- Dynamics 365 service administrator
- Dynamics 365 system administrator

Answer Area

Function	Role
Create new users.	Role
Assign roles to users.	Role
Perform backups for an instance.	Role

Suggested Answer:





Box 1: Office 365 Global Administrator You may think that the Dynamics 365 system administrator would have power to do all the actions needed to manage Dynamics 365, but this is not the case. What's different in Microsoft cloud deployments is that licenses and user accounts are managed in Office 365 by an Office 365 Global Administrator. This role is analogous to a network administrator for an on premises deployment. The Global Administrator is the only role to create new user accounts and assign subscription licenses for Dynamics 365 (and other Office 365 apps such as Skype, Power BI and SharePoint). Box 2: Dynamics 365 system administrator The Dynamics 365 system administrator may assign roles and permissions to the Dynamics 365 user within an instance of Dynamics 365. The Dynamics 365 system administrator also controls all the settings in Dynamics 365.

Box 3: Dynamics 365 admin - The Dynamics 365 admin can perform backups and restores. Reference: https://docs.microsoft.com/en-us/power-platform/admin/use-service-admin-role-manage-tenant
https://community.dynamics.com/crm/b/govandthecity/posts/understanding-dynamics-365-and-office-365-admin-roles

DRAG DROP -

You are designing an app for a bank.

You must create entities for the app and configure relationships between entities:

Which relationship types should you use? To answer, drag the appropriate relationship types to the correct requirements. Each relationship type may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Select and Place:

Entity	Requirements
LoanApplicant	This entity represents a person who is applying for a loan. The entity must contain an attribute named Email. This attribute must provide look-up for the name of the applicant.
Loan	This entity represents a loan application. Loan applicants may apply for one loan per application. Loan applicants may have more than one active application.
Property	This entity represents the property that the applicant intends to purchase.

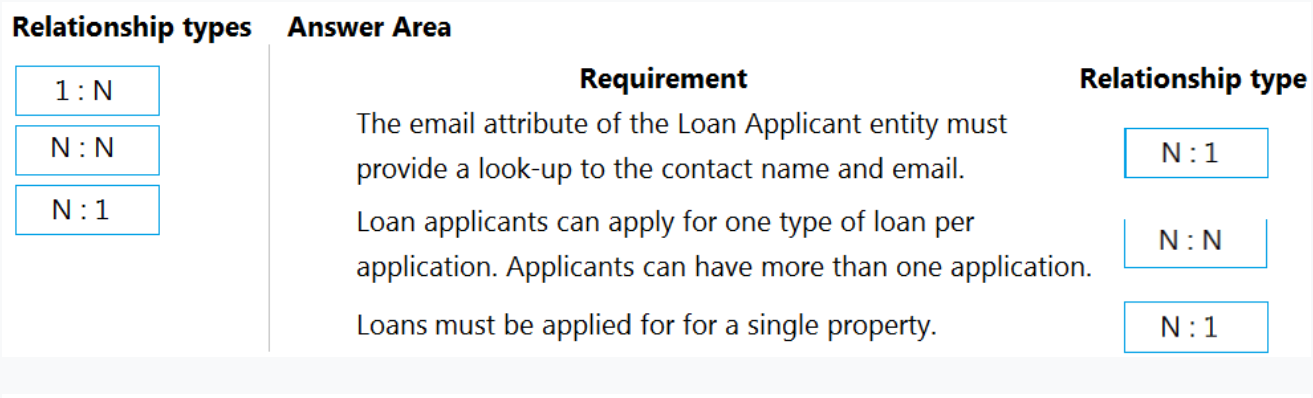
Relationship types

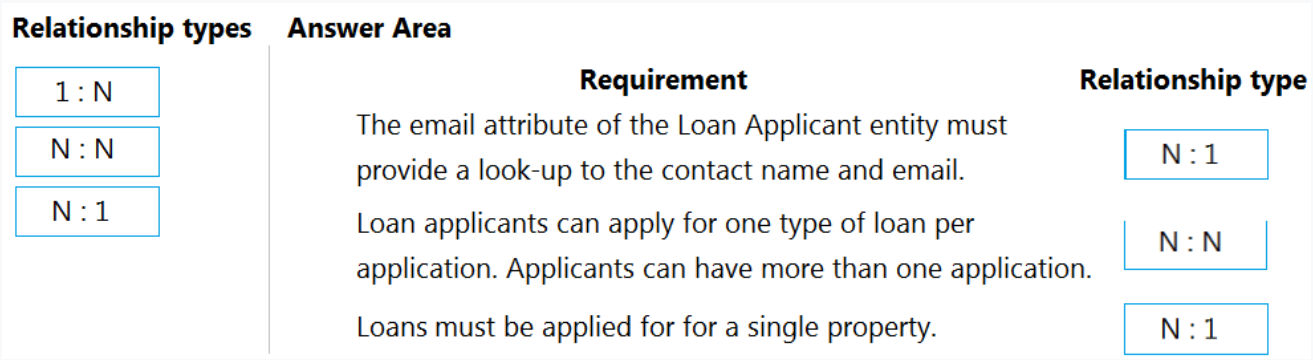
- 1 : N
- N : N
- N : 1

Answer Area

Requirement	Relationship type
The email attribute of the Loan Applicant entity must provide a look-up to the contact name and email.	
Loan applicants can apply for one type of loan per application. Applicants can have more than one application.	
Loans must be applied for for a single property.	

Suggested Answer:





Box 1: N:1 - You add a lookup column with a many-to-one relationship.

Box 2: N:N -

Box 3: N:1 - Reference: https://docs.microsoft.com/en-us/powerapps/maker/data-platform/data-platform-entity-lookup

ArezouDynamics Highly Voted 4 years, 9 months ago

The provided answer is correct! So, a trick to identify the relationships: If table A has a look up field to table B : A to B relationship is : N:1. I suggest to do a quick test and it will be more clear.

upvoted 44 times

mecreative Highly Voted 4 years, 12 months ago

I'm a little confused. Do we have to assume that one loan application can contain several applicants? Can anyone who has had this question confirm if N:N is the expected answer?

upvoted 3 times

Christoz Most Recent 1 year, 2 months ago

1. N : 1 - A many-to-one (N:1) relationship from LoanApplicant to Contact (or similar entity) allows multiple applicants to reference the same email/contact. 2. 1 : N - A one-to-many (1:N) relationship from LoanApplicant to Loan means one applicant can have multiple loan applications. 3. N : 1 - A many-to-one (N:1) relationship from Loan to Property ensures that multiple loans can reference a single property.

upvoted 7 times

isabelcha 1 year, 9 months ago

Do we have to assume one loan application can contain several applicants? I don't think its reasonable to expect the test taker to make such assumption. Or am I missing something?

upvoted 4 times

WikyWik 2 years, 5 months ago

I say the answer is: (1) N:1. Because the lookup column. (2) N:1. It is stated that the LoanApplicant Enitity represents A PERSON & applicants can have more than 1 application. One loan can't be connected to multiple applicants. (3) 1:N. Multiple loans "multiple people/applicants" can apply for the same house

LoanApplicant Table rows and columns example: FirstName | LastName | Email How can there be a many to many (N:N) relationship in box 2? That would only be possible if the LoanApplicant contained duplicates of the same person or the LoanApplicant table also contained the loan applied for. In that case it would be more like a FACT table but LoanApplicant seems to suggest it is a Dimension table.

upvoted 1 times

nicknamety 3 years, 2 months ago

There is missing context in my opinion. One could reasonably assume that the LoanApplicant table does not contain duplicates. If LoanApplicant only contains a person's name and email, then it is basically like a contact table. Therefore, there would be a 1:N relationship with the Loan table that has multiple loan applications of that applicant. Poorly worded question.

Question #17 *Topic 1*

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You administer the Microsoft 365 and Power Platform environments for Contoso, Ltd. The company has a model-driven app that is used to track customer interactions with employees. The app uses standard table types for customers. A user named Elisabeth Rice signs in to the app by using the following sign in name: Elisabeth.Rice@contoso.com.
After marriage, Elisabeth changes her legal name to Elisabeth Mueller.
You need to update the sign in name for the user without losing any application history.
Solution: Change Elizabeth's username in the user record for the app.
Does the solution meet the goal?

A. Yes

B. No

Suggested Answer: *A*
Change a user's email address - You must be a global admin to complete these steps. 1. In the admin center, go to the Users > Active users page. 2. Select the user's name, and then on the Account tab select Manage username. 3. In the first box, type the first part of the new email address. If you added your own domain to Microsoft 365, choose the domain for the new email alias by using the drop-down list. Learn how to add a domain. 4. Select Save changes. Reference: https://docs.microsoft.com/en-us/microsoft-365/admin/add-users/change-a-user-name-and-email-address

The provided solution does not fully meet the goal. Changing Elisabeth's username in the user record for the app will update her sign-in name for the app itself, but it won't update her sign-in name for the broader Microsoft 365 and Power Platform environments. To ensure that her sign-in name is updated across all relevant services and to maintain application history, you should also update her username at the Microsoft 365 or Azure AD level, as well as in the Power Platform environment if necessary. So, the correct answer is: B. No
upvoted 9 times

SlowSheep Most Recent 11 months, 2 weeks ago
Answer is No. I don't believe Microsoft would encourage people to change user identities on single records instead of doing it for the whole ecosystem in Entra ID.

Kindum 2 years, 11 months ago

The Answer is No since the User information not change on the App instead it change on the MS O635 Admin Center so the Answer is wrong, that is not "Yes"

upvoted 1 times

Mayah974 3 years, 1 month ago

I think is YES because You are MS365 Administer. You can change username. I'm wrong ?

upvoted 1 times

FaresAyyad 3 years, 5 months ago

https://learn.microsoft.com/en-us/microsoft-365/admin/add-users/change-a-user-name-and-email-address?view=o365-worldwide By reviewing the link, you can see that changing will only be from the Admin center.

upvoted 3 times

Radoslavov 3 years, 5 months ago

I will say No, just because the proposed solution is "Change Elizabeth's username in the user record for the app" and in D365 the User Name filed is locked for edit, as this is synced from Azure AD, if I would change it anywhere it will be Azure AD or Users/Active Users/ and then change the email address, which will sync back to CRM with the next sync cycle.

If you look at Topic 1, Question 18 you see the correct answer. The proposed solution for #17 is to change it in the Model Driven app which will have no impact on the M365Admin Center.

upvoted 2 times

RichXP 3 years, 7 months ago

since tracking customers interaction with employees. what would be used in customers table for employee field, I would say "username" or "email address". So best way to do it would be just changing display name, also give Elizabeth an alias email for her to sign in.

upvoted 2 times

Question #18 *Topic 1*

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You administer the Microsoft 365 and Power Platform environments for Contoso, Ltd. The company has a model-driven app that is used to track customer interactions with employees. The app uses standard table types for customers. A user named Elisabeth Rice signs in to the app by using the following sign in name: Elisabeth.Rice@contoso.com.
After marriage, Elisabeth changes her legal name to Elisabeth Mueller.
You need to update the sign in name for the user without losing any application history.
Solution: Ask the Microsoft 365 administrator to sign in to the admin portal and change the username.
Does the solution meet the goal?

A. Yes

B. No

Suggested Answer: *A*
Change a user's email address - You must be a global admin to complete these steps. 1. In the admin center, go to the Users > Active users page. 2. Select the user's name, and then on the Account tab select Manage username. 3. In the first box, type the first part of the new email address. If you added your own domain to Microsoft 365, choose the domain for the new email alias by using the drop-down list. Learn how to add a domain. 4. Select Save changes. HOTSPOT -

You need to create a system chart for the Account entity.

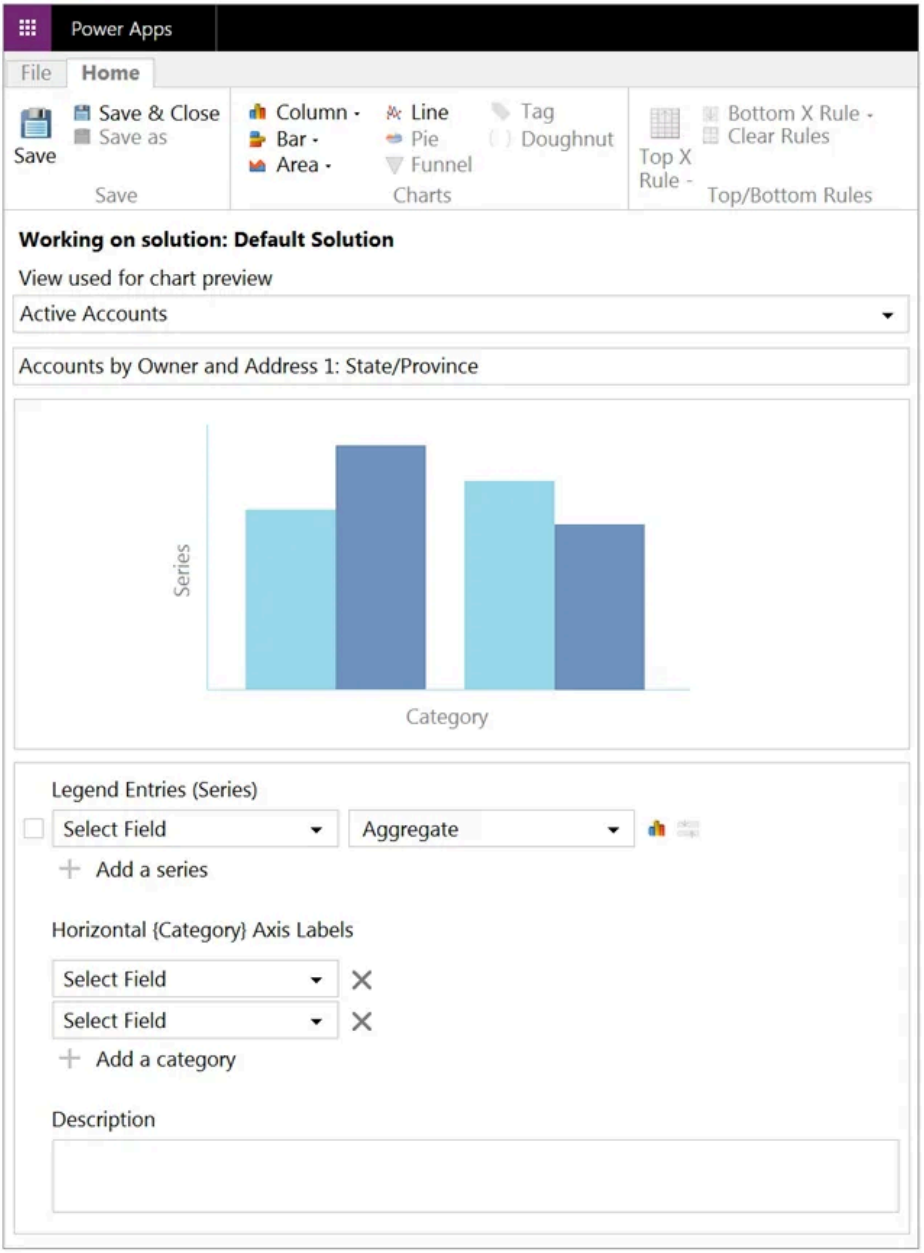
The chart must display a count of accounts grouped by owner and then display the accounts by Address 1: State/Province for each owner. You begin to configure chart options as shown in the image below.

How should you complete the configuration? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point. The chart must display a count of accounts grouped by owner, and then display the accounts by Address 1 to

State/Province for each owner.

Hot Area:



Answer Area

Component	Selection
Legend Entries (Series): Select Field	Account Address 1: State/Province Owner
Legend Entries (Series): Aggregate	Avg Count:All Sum
Horizontal (Category) Axis Labels: Select Fields	
First grouping field	Account Address 1: State/Province Owner
Second grouping field	Account Address 1: State/Province Owner

Suggested Answer:

Question #21 *Topic 1*

A user has access to an existing Common Data Service database.
You need to ensure that the user can create canvas apps that consume data from Dataverse. You must not grant permissions that are not required.
Which out-of-the-box security role should you assign to the user?

A. Environment Admin

B. System Customizer

C. Common Data Service User

D. Environment Maker

Suggested Answer: *D*
Reference: https://docs.microsoft.com/en-us/power-platform/admin/database-security#predefined-security-roles
https://docs.microsoft.com/en-us/powerapps/maker/canvas-apps/data-platform-create-app

Community vote distribution

mdnaseershah Highly Voted 3 years ago
Answer is B: System Customizer From Microsoft: "Users who make apps that connect to the database and need to create or update entities and security roles must have the System Customizer role in addition to the Environment Maker role. The Environment Maker role doesn't have privileges on the environment's data." Ref: https://learn.microsoft.com/en-us/power-platform/admin/database-security#environments-with-a-dataverse-databaseSorry. The question didn't mention the need to create or update entities. Its requirement is to just be able to create an app. So the answer should be "Environment Maker".also the user already has access to the Dataverse
upvoted 9 times

mdnaseershah Highly Voted 3 years ago

Kazzix 3 years, 11 months ago
I think it's correct: the user already has access to the CDS, so he doesn't need more privileges other than being able to create apps. So D, Environment Maker, should be right
upvoted 7 times

eb60697 Most Recent 2 years ago
1. This is an outdated question. It is the same as Question 34 but instead Microsoft Dataverse database it says Common Data Service (CDS) database. CDS was the former name of the Microsoft Dataverse. Also, there is here the option Common Data Service user, that is the old name for the Basic User that is in the question 34. 2. The answer D “Environment Maker” is CORRECT because: A) although the Environment Maker role doesn't have privileges on the environment's data, here the question establishes that the user already has access to the database. And B) the question does

not mention that the user needs to create or update entities, its requirement is just to create apps. So the user does need to have access to data, but not necessarily customize anything .

upvoted 6 times

user861243 2 years, 3 months ago

It has to be Environment Maker. On Exam Apr 2024

upvoted 2 times

GD27 2 years, 4 months ago

It will be B

upvoted 1 times

Brooklyn_ 2 years, 10 months ago

ChatGPT said C To ensure that a user can create canvas apps that consume data from Dataverse without granting unnecessary permissions, you should assign the "C. Common Data Service User" security role to the user.

The "Common Data Service User" security role provides the appropriate level of access to create and manage canvas apps, as well as consume data from Dataverse. This role is designed for users who primarily need to work with data in the Dataverse and build applications but do not require administrative access.

upvoted 1 times

upvoted 2 times

Mikiee 3 years, 9 months ago

Provided answer is correct because this user has access to CDS already, so B. System Customizer role is not necessary.

upvoted 2 times

allesglar 3 years, 10 months ago

Only grant permissions required. So environment maker should be correct.

upvoted 3 times

Daniel_Lee 3 years, 11 months ago

The user already has access to CDS based on "A user has access to an existing Common Data Service database.". What the use needs is the permission to only create an app based on "You need to ensure that the user can create canvas apps that consume data from Dataverse." Environment Maker can be an answer because it gives a permission to create app but not a permission to use CDS based on "You must not grant permissions that are not required." (Least Privileged)

upvoted 3 times

HOTSPOT -

A company deploys several model-driven apps. The company uses shared devices in their warehouse. The devices are always powered on. Users log on to the devices and then launch the apps to perform actions.

Unauthorized users recently uploaded several files after another user failed to log out of a device. The company needs to prevent these incidents from occurring in the future.

You need to configure the solution to prevent the reported security incidents.

What should you do? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

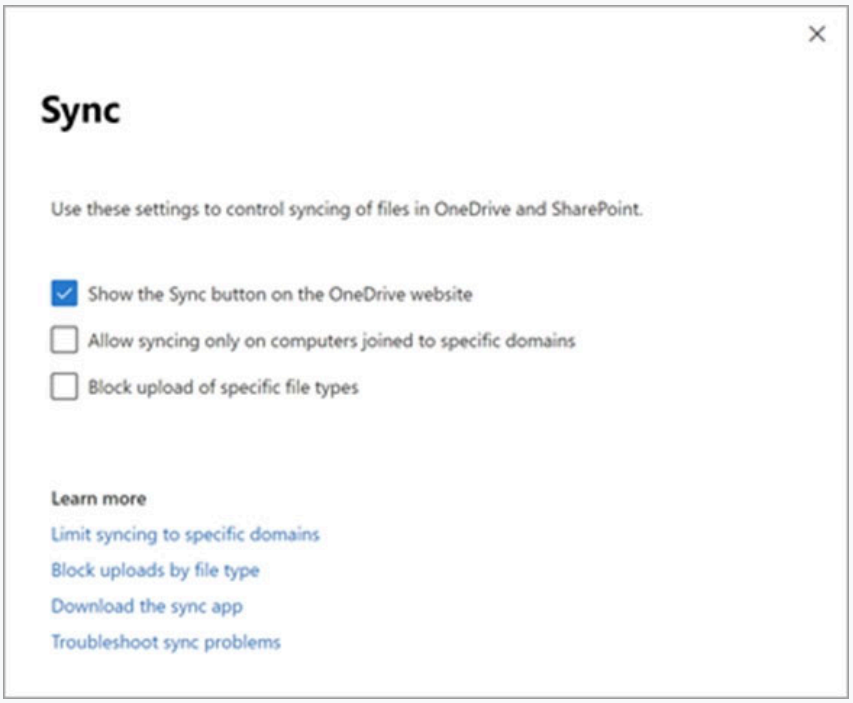
Answer Area

Requirement	Action
Prevent unauthorized access to devices.	Set an inactivity limit in the user's group policy. Set a timeout in the Power Platform admin center. Configure access controls in Azure Active Directory. Configure a Power Automate flow to poll for user inactivity on the devices.
Prevent users from uploading a specific type of file.	Enter the restricted file types in the SharePoint admin center. Enter the allowed file types in the Power Platform admin center. Enter the restricted file types in the Power Platform admin center.

Suggested Answer:

Answer Area

Requirement	Action
Prevent unauthorized access to devices.	Set an inactivity limit in the user's group policy. **Set a timeout in the Power Platform admin center.** Configure access controls in Azure Active Directory. Configure a Power Automate flow to poll for user inactivity on the devices.
Prevent users from uploading a specific type of file.	**Enter the restricted file types in the SharePoint admin center.** Enter the allowed file types in the Power Platform admin center. Enter the restricted file types in the Power Platform admin center.



Answer Area

Requirement	Action
Prevent unauthorized access to devices.	Set an inactivity limit in the user's group policy. **Set a timeout in the Power Platform admin center.** Configure access controls in Azure Active Directory. Configure a Power Automate flow to poll for user inactivity on the devices.
Prevent users from uploading a specific type of file.	**Enter the restricted file types in the SharePoint admin center.** Enter the allowed file types in the Power Platform admin center. Enter the restricted file types in the Power Platform admin center.

Box 1: Set a timeout in the Power Platform admin center. To enforce users to reauthenticate after a pre-determined period of time, admins can set a session timeout for their individual environments. Users can only remain signed in the application for the duration of session. The application signs out the user when the session expires. Users need to sign in with their credentials to return to customer engagement apps.

Note: Configure session timeout - 1. In the Power Platform admin center, select an environment. 2. Select Settings > Product > Privacy + Security. 3. Set Session Expiration and Inactivity timeout. These settings apply to all users. Incorrect:

Configure inactivity timeout - 1. In the Power Platform admin center, select an environment. 2. Select Settings > Product > Privacy + Security. 3. Set Session Expiration and Inactivity timeout. These settings apply to all users. Box 2: Enter the restricted file types in the SharePoint admin

center. To block uploading of specific file types 1. Go to the Settings page of the new SharePoint admin center, 2. Select Sync.

3. Select the Block upload of specific file types check box. 4. Enter the file name extensions you want to block, for example: exe or mp3. 5. Select Save. Reference: https://docs.microsoft.com/en-us/power-platform/admin/user-session-management https://docs.microsoft.com/en-us/onedrive/block-file-types

imbaster Highly Voted 4 years, 11 months ago

Second Answer is wrong: should be "Enter the restricted file types in the PowerPlatform Admin center". This exam does not cover SharePoint.

Set blocked file extensions for attachments (semicolon separated) has to be done in Power Platform admin center. https://docs.microsoft.com/en-us/power-platform/admin/settings-privacy-security Prevent upload or download of certain attachment types that are considered dangerous. Separate file extensions with a semicolon. Default extensions: ade; adp; app; asa; ashx; asmx; asp; bas; bat; cdx; cer; chm; class; cmd; com; config; cpl; crt; csh; dll; exe; fxp; hlp; hta; htr; htw; ida; idc; idq; inf; ins; isp; its; jar; js; jse; ksh; lnk; mad; maf; mag; mam; maq; mar; mas; mat; mau; mav; maw; mda; mdb; mde; mdt; mdw; mdz; msc; msh; msh1; msh1xml; msh2; msh2xml; mshxml; msi; msp; mst; ops; pcd; pif; prf; prg; printer; pst; reg; rem; scf; scr; sct; shb; shs; shtm; shtml; soap; stm; tmp; url; vb; vbe; vbs; vsmacros; vss; vst; vsw; ws; wsc; wsf; wsh

upvoted 26 times

Abokhate Most Recent 1 year, 1 month ago

In the first question: prevent unauthorized access to devices possible actions, I choose "Set an inactivity limit in the user's group policy" because that allows you to force log out after a inactivity time. Second option only log out the user log in the app, not in Power Platform

upvoted 2 times

Christoz 1 year, 2 months ago

In practice, you know which file types you want to allow than the ever-increasing list file types you may want to restrict.

upvoted 2 times

MVPConsultant 2 years ago

Looks like you can do both of these in power platform admin center steps are environment - select the environment - settings - privacy and security = session expiration is there and blocked attachments

upvoted 3 times

LRRooster 2 years, 2 months ago

As an architect, I would never let users upload to the dataverse simply because the cost is prohibitive! I would use sharepoint, that said, i would restrict file types in sharepoint not through power platform admin center. The first question is a little bit tricky because you could set a blanket time out policy on for all the devices using Microsoft Entra Domain Services or you could set the timeout feature in power platform admin center. So you would have to choose which one fits for the exam.

upvoted 1 times

WikyWik 2 years, 5 months ago

Second Answer is wrong. Model Driven Apps can't use SP as datasource

upvoted 2 times

solidshag 2 years, 6 months ago

Second answer is the third option.

upvoted 1 times

Sri2020 2 years, 6 months ago

1.Set a timeout in the Power Platform admin center. 2 .Enter the restricted file types in the Power Platform admin center. Go to Power Platform admin center --> Environmentts --> Settings --> Privacy + Security Set inactivity timeout " On" Set blocked file extensions for attachments (semicolon separated) has to be done in Power Platform admin center.

upvoted 1 times

wajid124 2 years, 11 months ago

Set inactivity timeout > Default: Off. Enable to automatically sign out a user.

upvoted 2 times

inzagi 3 years ago

Rirst ansver should be 1 Group Policy (One because you need to block access to shared device and not to PowerApp) 3 Second Answer is wrong: should be "Enter the restricted file types in the PowerPlatform Admin center".

upvoted 2 times

Aero_1898 3 years, 1 month ago

1st should be 1 No, you cannot set a timeout for user inactivity in the Power Platform admin center. The Power Platform admin center allows administrators to manage settings for Power Apps, Power Automate, and other Power Platform services, but it does not have the ability to automatically log out users from shared devices after a period of inactivity. To automatically log out users from shared devices after a period of inactivity, you would need to use a feature of the operating system, such as Group Policy for Windows devices. This can be done through the Group Policy Management Console on a Windows server or through the Local Group Policy Editor on a Windows client computer.

upvoted 4 times

Leylae 3 years, 9 months ago

this is hard to decide... I feel for 2nd answer 1 and 3 are both correct, it depends on how App set it up... I think because the exam is more about power platform, so I will go with 3, set restrict file type on power platform admin center. ref https://support.microsoft.com/en-us/topic/power-automate-approval-attachment-limitations-and-restrictions-f19bc97c-b353-e3af-b156-6fb6a5a9c273

this is hard to decide... I feel for 2nd answer 1 and 3 are both correct, it depends on how App set it up... I think because the exam is more about power platform, so I will go with 3, set restrict file type on power platform admin center. ref https://support.microsoft.com/en-us/topic/power-automate-approval-attachment-limitations-and-restrictions-f19bc97c-b353-e3af-b156-6fb6a5a9c273There is a clear reason why SharePoint is not a valid option. The question mentions model-driven apps, for which the data can only be stored on Dataverse, not any other Datasource.your able to store in sharepoint by use of the file location table, i use it for portals but the functionality is there for modal driven apps to use sharepoint as a backend for the file, and if there block was put there it would work.still since sharepoint is not mentioned, maybe the customer is using a debian nextcloud solution as a file location :-). and the question speaks of model driven app (i know about the document tab... but i would rather go for the scenario to upload to e.g. email attachment -> which i would never recommend of course).

HOTSPOT -

A company's sales staff wants a simplified way to manage their opportunities in Dynamics 365 Sales without adding custom code.

You need to provide a solution for each requirement.

Which solutions should you provide? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Requirement	Solution
Drag and drop opportunities to change the stage.	Add a Kanban control. Add a Timeline control. Add an Editable Grid control. Add a Calendar control.
Show each salesperson their opportunities in Calendar and Kanban view.	Add both controls to a custom view. Add both controls to the My Opportunities view. Add one control to All Opportunities and a custom view. Add one control to My Opportunities and a custom view.
Show each salesperson the number of open opportunities by stage in a standard view.	Use the List view. Use the Timeline control. Use the Kanban control. Use the chart pane on the view.

Suggested Answer:

Answer Area

Requirement	Solution
Drag and drop opportunities to change the stage.	Add a Kanban control.
Show each salesperson their opportunities in Calendar and Kanban view.	Add both controls to the My Opportunities view.
Show each salesperson the number of open opportunities by stage in a standard view.	Use the List view.

Answer Area

Requirement	Solution
Drag and drop opportunities to change the stage.	Add a Kanban control.
Show each salesperson their opportunities in Calendar and Kanban view.	Add both controls to the My Opportunities view.
Show each salesperson the number of open opportunities by stage in a standard view.	Use the List view.

Box 1: Add a Kanban control. The Kanban view allows your sales team to move opportunities from one stage to another by simply dragging them. Box 2: Add both controls to the My Opportunities view. ✑ Kanban views help salespeople to manage their opportunities and activities effectively. Add the Kanban control to the Opportunity and Activity entity so salespeople can use the Kanban views. The Kanban control works only on the Opportunity and Activity entities. ✑ If you use unified interface, you can display any record in a calendar view via the calendar control. - Go to Settings->Customization->Customize the System - Open the configuration for the entity that you want to use the calendar control (Opportunities in our example) - Click the View tab - Click ג€Add Controlג€ and select the calendar control. - Click the dot for every interface from which you want the calendar control to be available.

Box 3: Use a List view - opportunities in Dynamics 365 Sales Reference: https://docs.microsoft.com/en-us/dynamics365-release-plan/2020wave1/dynamics365-sales/work-opportunities-kanban-view https://crmtipoftheday.com/1206/view-any-dynamics-365-record-on-a-calendar/ https://fivep.com.au/how-to-get-visibility-and-report-on-an-opportunities-active-current-sales-stage-without-code-microsoft-dynamics-365/

I don't understand why there are so many Dynamics questions when there is no mention of Dynamics in the PL200 'Skills Measured' document..? Because this exam used to be called MB-200 (Exam MB-200: Microsoft Power Platform + Dynamics 365 Core) and changed to PL-200 without Dynamics but the administrators didn't make care to remove the questionsVico93 meant the administrators of examtopics or in the real exam?the real exam, dynamics questions still appearThere is no path for D365 devs, because D365 is a part of the Power Platform stack. It is a model-driven app in the end.

upvoted 1 times

marcelina50 3 years, 2 months ago

Last one should be Kanban. Because it gives you a count of the records and can be configured to sort by stage

upvoted 3 times

HaiderLyger 3 years, 3 months ago

1) Correct 2) You can't add two controls to a single view, just checked. The correct answer should be "Add one control to MY Opportunity and a custom view" 3) Charts is correct

upvoted 12 times

anshhuln 3 years, 5 months ago

On Exam, March 2023 Selected 1) Kanban 2) My Opportunities 3) Chart Pane

upvoted 4 times

_Nuni 3 years, 9 months ago

I think the given answers are correct: 1. Drag and drop opportunities to change the stage ** This is Add a Kanban Control Reference: https://learn.microsoft.com/en-us/dynamics365-release-plan/2020wave1/dynamics365-sales/work-opportunities-kanban-view

2. Show each salesperson their opportunities in Calendar and Kanban View ** Add both controls to the My Opportunities view Note: You can enable Kanban and Calendar views for any entity Reference: https://ahaapps.com/kanban-and-calendar-view-for-activities-in-dynamics-365-crm/

3. Show each salesperson the number of open opportunities by stage in a standard view ** This can be done through a list view Note: The wording 'simplified' and 'standard' seem important here for deciding between a list view and a chart pane. With a view, you'll be able to see all open opportunities and sort by stage

upvoted 2 times

_Nuni 3 years, 9 months ago

upvoted 3 times

BrettusMaximus 4 years, 1 month ago

Based on all discussion threads I have gone with a: Kanban control - (Does it well) b: Add one control to My Opportunities and a custom view (only one control) (only one control per view when directly added) c: List view (can sort by stage - does not allow chart or Kanban)

upvoted 3 times

Isjosh 4 years, 1 month ago

I would recommend the answer is: Add a Kanban control Add both controls to the My Opportunities view List view Chart are view based so the view would be logical

upvoted 1 times

Druey 4 years, 1 month ago

I believe that in the third question Kanaban and Chart Pane are both valid. Could anyone explain to me if I am wrong. I have tried and I am able to see the number of the opportunities in a specific stage at the top of each Kanaban column (a column for each stage). So why is Kanaban wrong?

upvoted 1 times

ManuB 4 years, 1 month ago

Add Both Controls to My Opportunities view won't work, I have tried it, you can only add one control per view, so a second custom view needs to be defined from a copy of My Opportunities view to add the calendar.I don't think you are correct. You can add multiple controls to a view. I think the answer is: Add a Kanban control Add both controls to the My Opportunities view Either List view or Chart. This one I'm not sure on. But the standard Kanban view does include aggregations. For each view, you can select with experienced is utilized (e.g. web, phone or table). When using the application, the user has the ability to switch which control is used by using the "Show As" button on the toolbar. In essence, you can have two controls on a singular view.You can add multiple controls to all vies from the entity settings but you can only add one control if you going to a specific view. in this case i think that it should be My opportunities and a custom view

upvoted 4 times

a: Kanban control b: Add one control to My Opportunities and a custom view (only one control) c: Kanban will do the job easily and chart pane is also an option (you need to setup a chart by Opportunity, aggregation count all and add an horizontal axis on pipeline phase). I would say also Kanban that

provides exactly the wanted resultI revise my answer for C, as it is mentioned standard view, the chart pane would be a better answer (even if the Kanban could be easily added to a standard view, that would results a customized view and not standard anymore, well this ambiguous)

upvoted 5 times

Question #24 *Topic 1*

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You administer the Microsoft 365 and Power Platform environments for Contoso, Ltd. The company has a model-driven app that is used to track customer interactions with employees. The app uses standard table types for customers. A user named Elisabeth Rice signs in to the app by using the following sign in name: Elisabeth.Rice@contoso.com.
After marriage, Elisabeth changes her legal name to Elisabeth Mueller.
You need to update the sign in name for the user without losing any application history.
Solution: From Dynamics 365 Settings, select Email Configuration. In the active mailbox for the user, update the name.
Does the solution meet the goal?

A. Yes

B. No

Suggested Answer: *B*
Change the user name, not the email configuration.

Change a user's email address - You must be a global admin to complete these steps. 1. In the admin center, go to the Users > Active users page. 2. Select the user's name, and then on the Account tab select Manage username. 3. In the first box, type the first part of the new email address. If you added your own domain to Microsoft 365, choose the domain for the new email alias by using the drop-down list. Learn how to add a domain. 4. Select Save changes. Reference: https://docs.microsoft.com/en-us/microsoft-365/admin/add-users/change-a-user-name-and-email-address

Question #25 *Topic 1*

You plan to implement Microsoft Dataverse.
You must track changes for two columns in the Account table. You must maintain a historical log of changes for the two columns and track only what is necessary.
You configure the appropriate organization settings.
You need to configure the system to track changes for the two columns.
Which two actions should you perform? Each correct answer presents part of the solution.
NOTE: Each correct selection is worth one point.

A. Enable auditing for the Account table.

B. Enable auditing for the two specific columns.

C. Enable change tracking for the Account table.

D. Enable change tracking for the two specific columns.

Suggested Answer: *A, B*
By setting the IsAuditEnabled property of a table's definition and the IsAuditEnabled property of each desired column's definition to true, data changes to records of those tables can be logged by the platform. Note: There are three levels where auditing can be configured: organization, table, and column. The organization level is the highest level, followed by the table level, and finally the column level. For column auditing to take place, auditing must be enabled at the column, table, and organization levels. For table auditing to take place, auditing must be enabled at the table and organization levels. Question #26 *Topic 1*

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
On a Contact record, a user creates a Note record that contains the word running.
One week later, the user reports that they cannot find the Contact record associated with the Note record.
You need to find the Note record.
Solution: Use Categorized Search to search for the word run.
Does the solution meet the goal?

A. Yes

B. No

Suggested Answer: *B*
Instead use Relevance Search. Note: Relevance Search finds matches to any word in the search term in any field in the entity. Matches may include inflectional words, like "stream," "streaming," or "streamed." Reference: https://docs.microsoft.com/en-us/power-platform/admin/configure-relevance-search-organization#what-is-relevance-search

Question #27 *Topic 1*

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
On a Contact record, a user creates a Note record that contains the word running.
One week later, the user reports that they cannot find the Contact record associated with the Note record.
You need to find the Note record.
Solution: Use Relevance Search to search for the word run.
Does the solution meet the goal?

A. Yes

B. No

Suggested Answer: *A*
Relevance Search brings the following benefits: ✑ Finds matches to any word in the search term in any field in the entity. Matches may include inflectional words, like "stream," "streaming," or "streamed." ✑ Includes the ability to search documents found in Notes and Attachments on Emails and Appointments Reference: https://docs.microsoft.com/en-us/power-platform/admin/configure-relevance-search-organization#what-is-relevance-search

DRAG DROP -

You are implementing a model-driven app to support a new line of business.

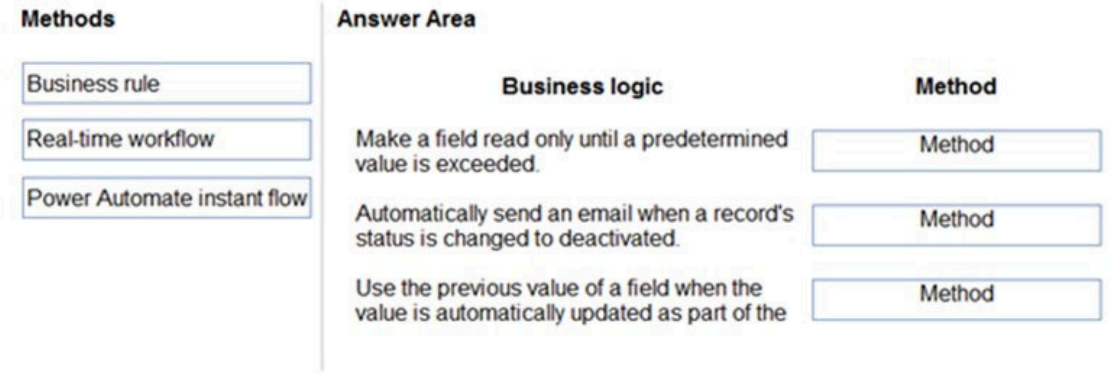
There are several places where automated business logic must be applied.

You need to determine how to apply the business logic.

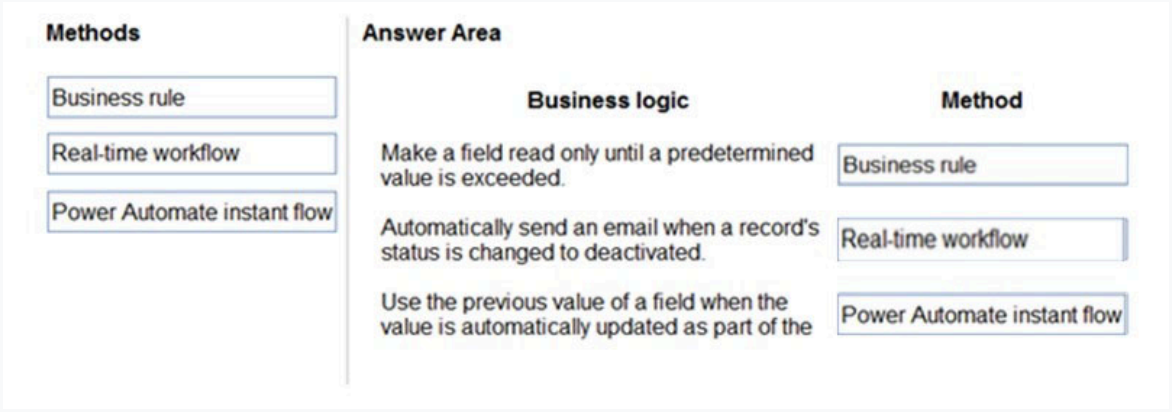
Which method should you use? To answer, drag the appropriate methods to the appropriate business logic statements. Each method may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

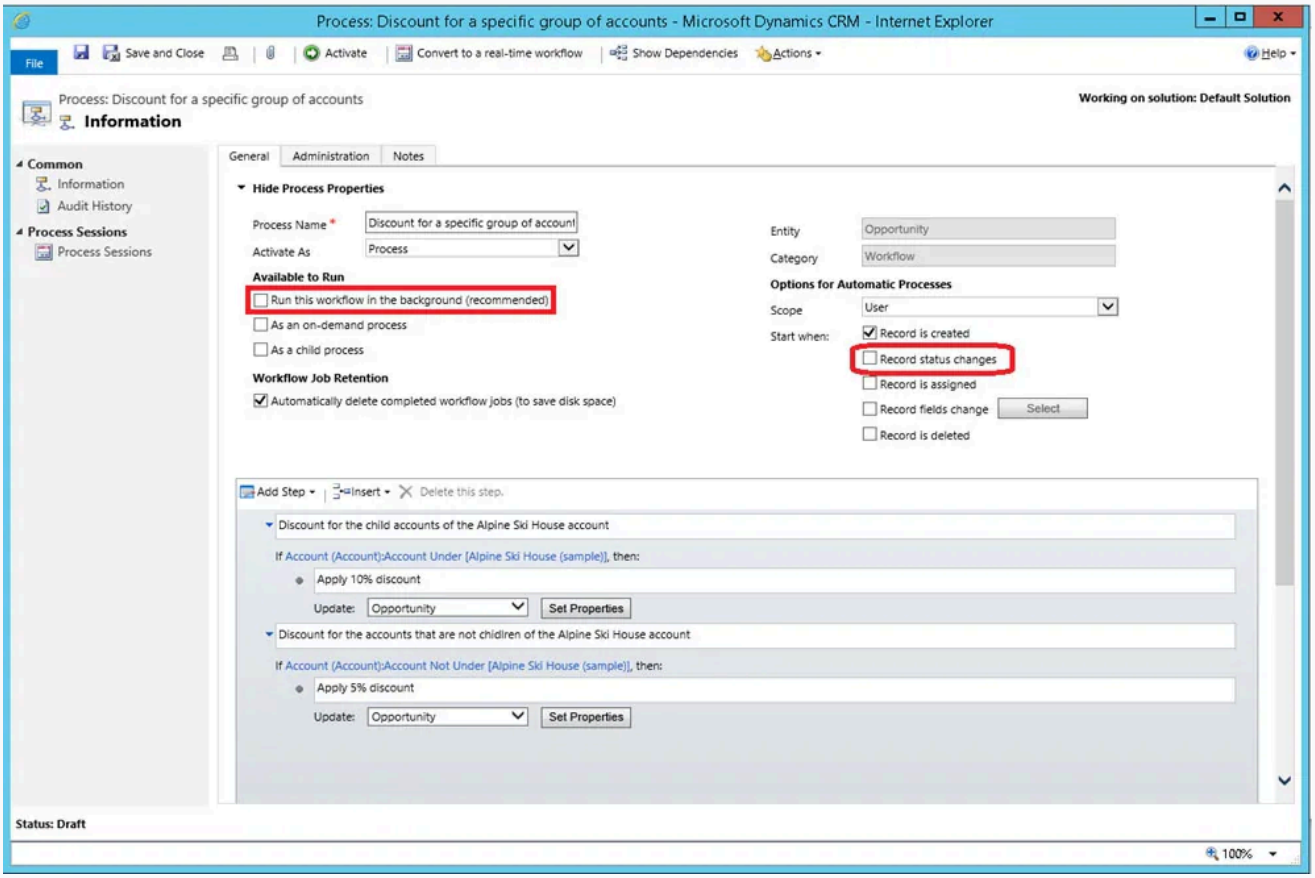
Select and Place:

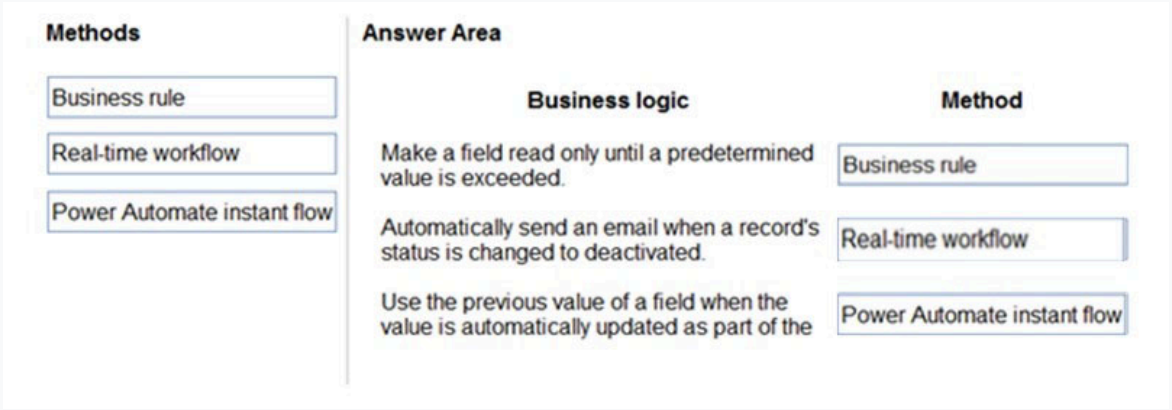


Suggested Answer:



.





Box 1: Business rule - By combining conditions and actions, you can do any of the following with business rules: ✑ Set column values

Clear column values -

➪ Set column requirement levels ➪ Show or hide columns ➪ Enable or disable columns ➪ Validate data and show error messages ➪ Create business recommendations based on business intelligence.

Box 2: Real-time workflow - Real-time workflows:

Box 3: Power Automate instant flow Instant Flows don't have a trigger in the same way as the Automated flow. Instead, they are triggered manually or on-demand, such as a user clicking a Flow button in the mobile app. Reference: https://docs.microsoft.com/en-us/powerapps/maker/model-driven-apps/create-business-rules-recommendations-apply-logic-form https://docs.microsoft.com/en-us/powerapps/maker/data-platform/configure-workflow-steps https://carldesouza.com/difference-between-instant-automated-and-scheduled-flows-in-power-automate-and-how-to-change-the-type/

Question #30 *Topic 1*

Your organization does not permit the use of custom code for solutions.
You need to create a view that can be viewed by all users in an organization.
Where should you create the view?

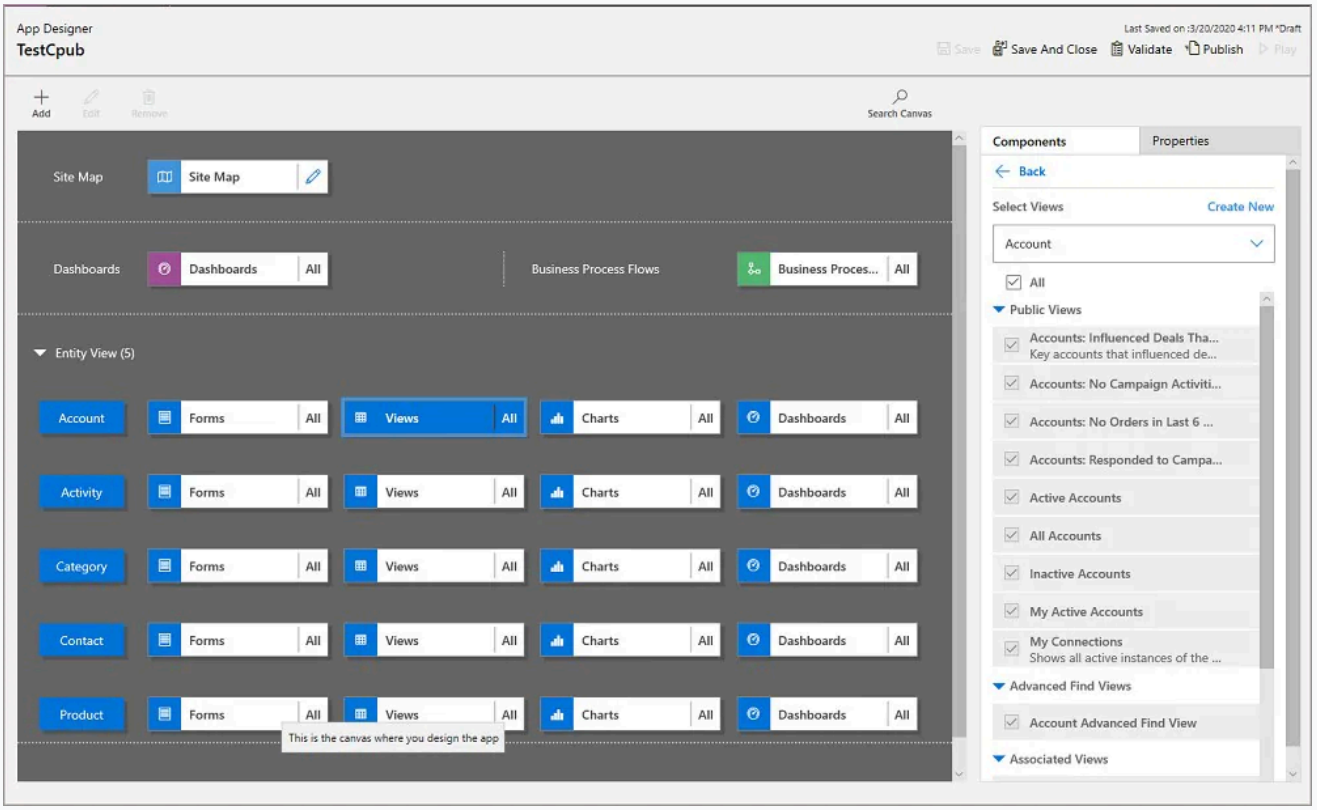
A. Advanced Find

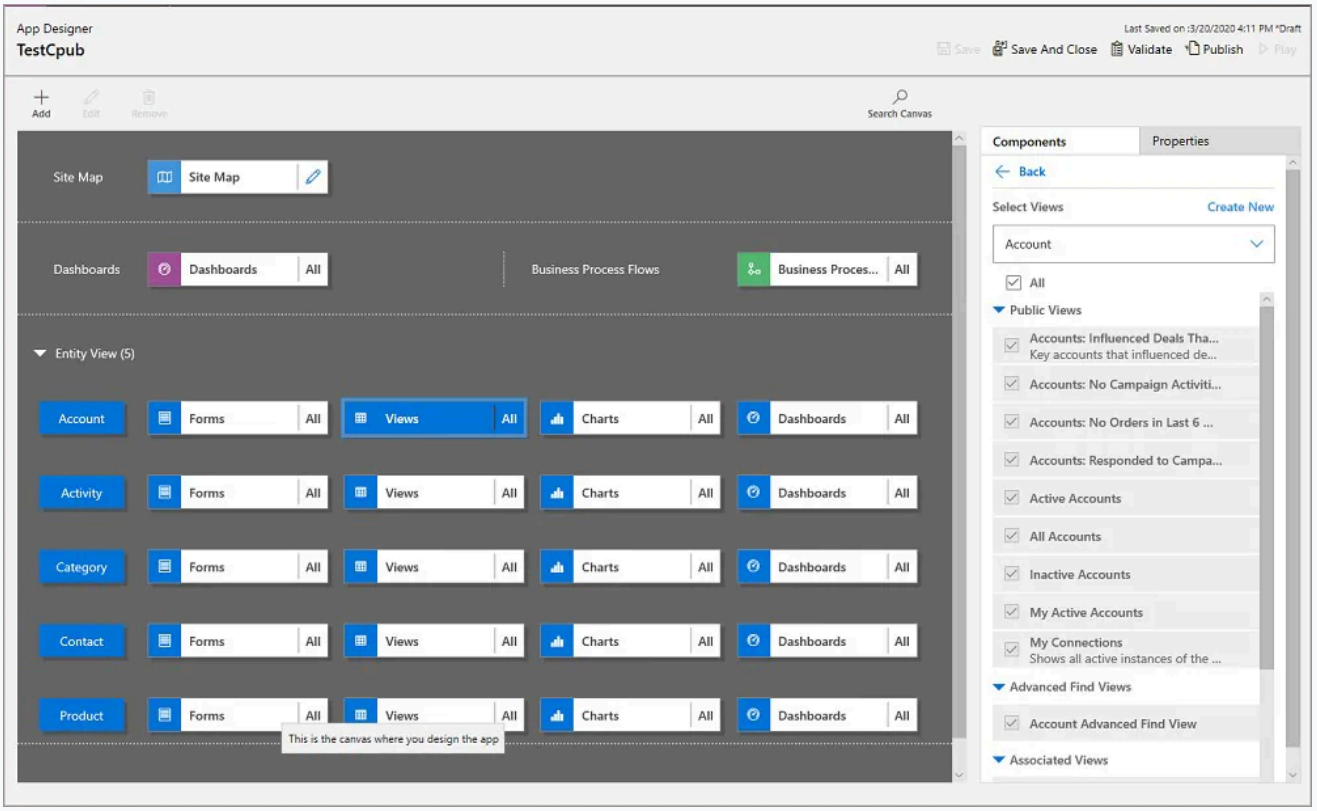
B. Entities component of a solution

C. Microsoft Excel template

D. Templates area

Suggested Answer: *A*





Open and add a view in the app designer The following steps explain how to open and add a view in the app designer. In Power Apps select Apps from the left navigation pane, select ... next to the app you want, and then select Edit. 1. In the app designer Table View section, select Views. 2. In this example, we have selected Views from the Account table.

3. To add a view, select it by using view types such as Public, Advanced Find, Associated, and Lookup. The view is automatically added to the Views list. Reference: https://docs.microsoft.com/en-us/powerapps/maker/model-driven-apps/create-edit-views-app-designer

Question no. 39 is same there the answer is : Entities component of a solution

upvoted 1 times

Dhananjay_Sharma 2 years, 5 months ago

B Entities component of a solution

upvoted 2 times

shrikantkarpur 2 years, 10 months ago

The question is to create view how come advance find where there are no public views in that?

upvoted 1 times

ShrikrishnaG 3 years ago

B. Entities component of a solution , is the correct answer . Please understand that in the classic view when we select entity section and under that when view is selected , we are popularted with four different types of views , with a provision to create a view .

upvoted 3 times

HARRISONP04 3 years ago

1000% B please note this is the same answer as "list view of the entity"

upvoted 4 times

KilaBite 3 years, 1 month ago

Agree with other sentiments on here. Answer should be B. Advanced Find has gone and you'd have to share the view out with all users too. I don't know what answer the real exam accepts however.

upvoted 1 times

Demmis 3 years, 1 month ago

It depends on how strict the company is. Based on the statement "Your organization does not permit the use of custom code for solutions." one can assume that a consultant would not be able to create a view in a solution and deploy to production and therefore option A makes sense as any user can pop into Advanced Find and create a view then share with work mates.

upvoted 1 times

wantbunda 3 years, 1 month ago

the correct answer is Entities component of solution

upvoted 1 times

Robby1234 3 years, 3 months ago

Screen shot is how it used to be. Today however you go to the entity and add the view there. Ans:B

upvoted 3 times

Titto 3 years, 3 months ago

Correct answer is B.

upvoted 1 times

HOTSPOT -

You develop a Power Apps app.

Users report that the main form does not display data from other entities or allow them to edit data from other entities.

You need to embed information from other entities in the form and allow users to edit the data.

Which actions should you perform? To answer, select the appropriate options in the answer area.

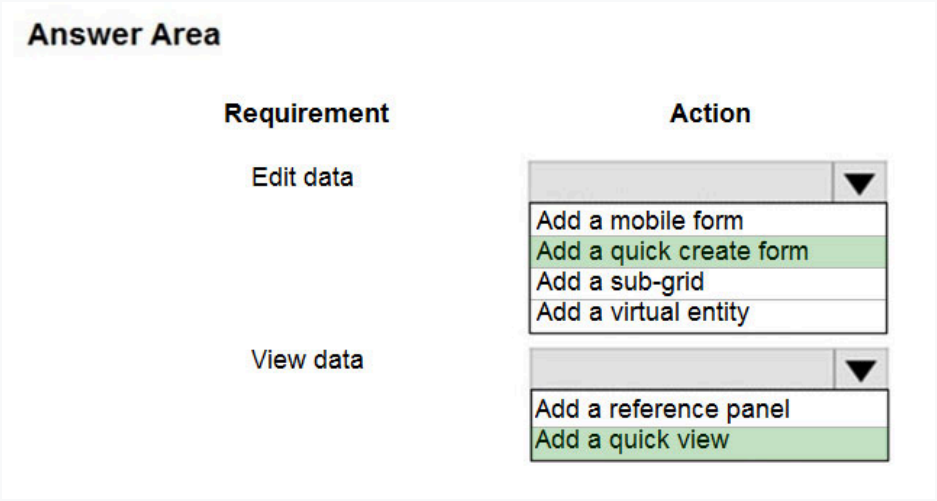
NOTE: Each correct selection is worth one point.

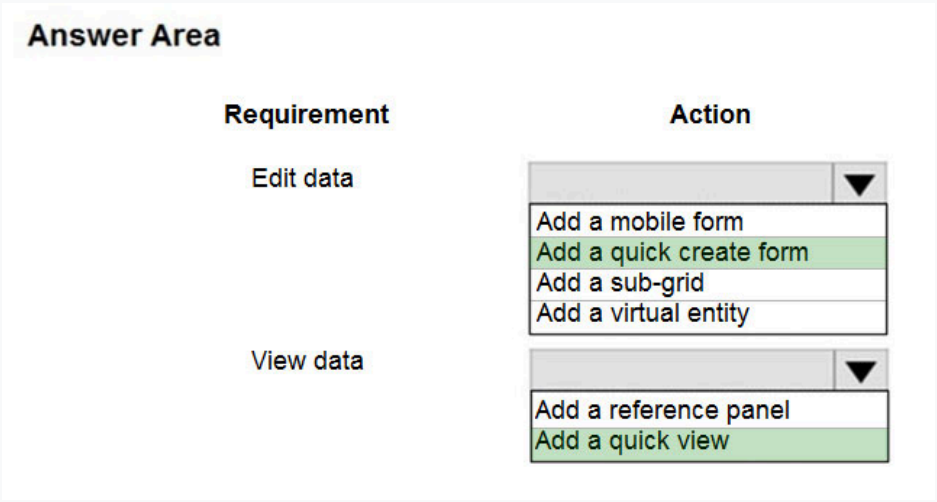
Hot Area:

Answer Area

Requirement	Action
Edit data	Add a mobile form Add a quick create form Add a sub-grid Add a virtual entity
View data	Add a reference panel Add a quick view

Suggested Answer:





Box 1: Add a quick create form - With quick create forms, your app can have a streamlined data entry experience with full support for logic defined by form scripts and business rules.

Box 2: Add a quick view - A quick view form can be added to another form as a quick view control. It provides a template to view information about a related entity record within a form for another entity record. This means your app users do not need to navigate to a different record to see the information needed to do their work. Reference: https://docs.microsoft.com/en-us/powerapps/maker/model-driven-apps/create-edit-quick-create-forms https://docs.microsoft.com/en-us/dynamics365/customerengagement/on-premises/customize/create-edit-quick-view-forms

HOTSPOT -

A company uses a canvas app to manage production resources in a specific region. Employees must be at company locations to use the app.

Due to a sudden requirement for employees to work remotely, employees no longer commute to a specific location to conduct their work and cannot access the canvas app.

You must reconfigure the app to ensure that employees only access the app from a limited number of locations.

You need to restrict access to the app.

Which components should you configure? To answer, select the appropriate options in the answer area.

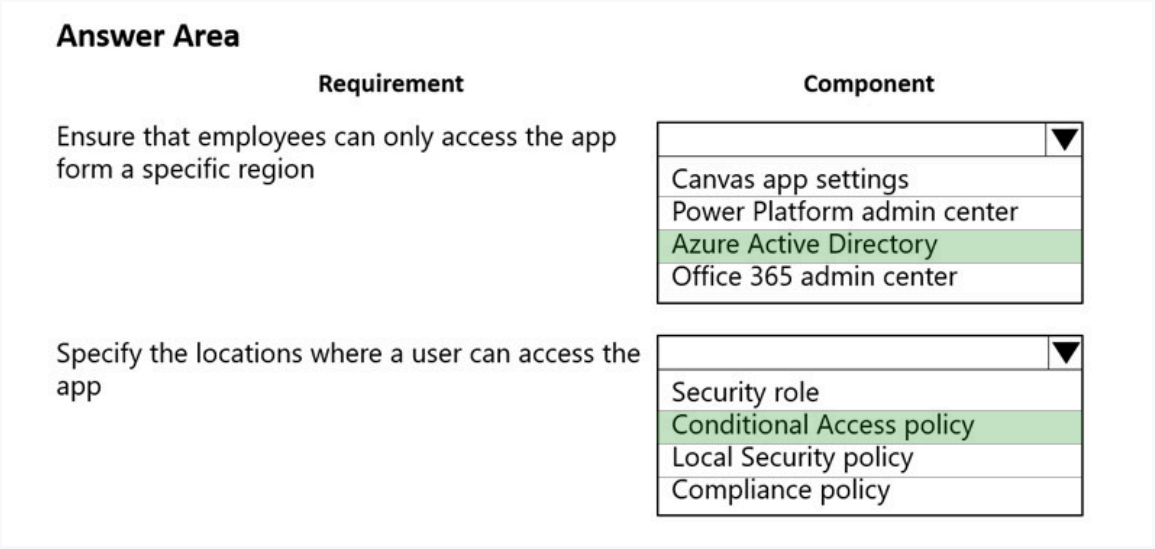
NOTE: Each correct selection is worth one point.

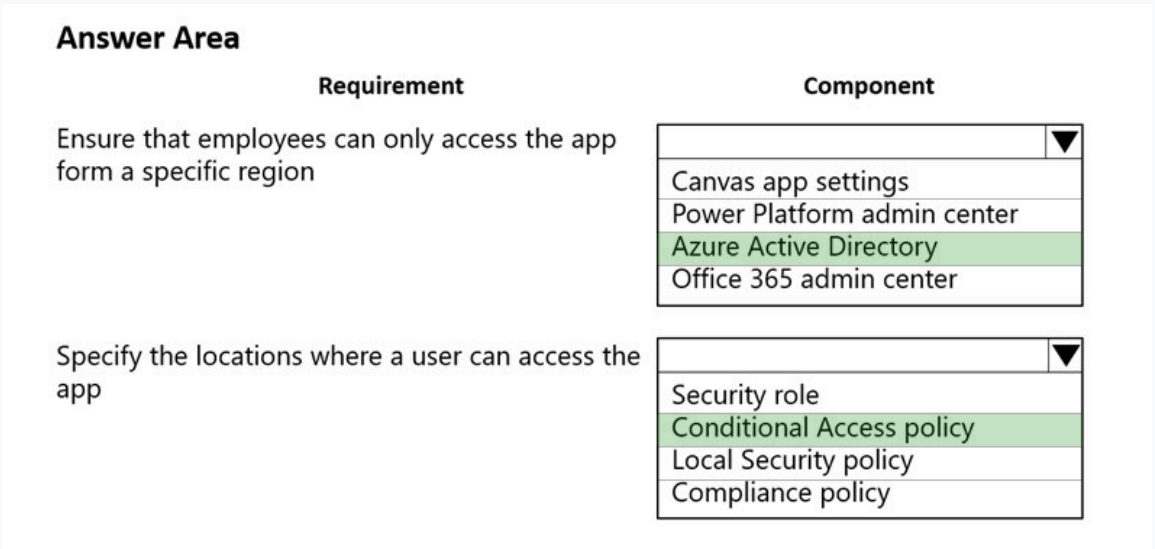
Hot Area:

Answer Area

Requirement	Component
Ensure that employees can only access the app form a specific region	Canvas app settings / Power Platform admin center / Azure Active Directory / Office 365 admin center
Specify the locations where a user can access the app	Security role / Conditional Access policy / Local Security policy / Compliance policy

Suggested Answer:





Reference: https://docs.microsoft.com/en-us/power-platform/admin/restrict-access-online-trusted-ip-rules

Question #33 *Topic 1*

You attempt to deactivate several currencies in a Microsoft Dataverse environment.
You are not able to deactivate one of the currencies.
You need to determine why you cannot deactivate the currency.
What is the reason?

A. You are not the currency record owner.

B. The currency is used by an active business process.

C. The currency is the base currency.

D. The currency is used by another record.

Suggested Answer: *C*
The base currency cannot be deactivated. Incorrect: Not D: You can't delete currencies that are in use by other records, but you can deactivate them. Deactivating currency records doesn't remove the currency information stored in existing records, such as opportunities or orders. However, you won't be able to select the deactivated currency for new transactions. Question #34 *Topic 1*

A user has access to an existing Microsoft Dataverse database.
You need to ensure that the user can create canvas apps that consume data from Dataverse. You must not grant permissions that are not required.
Which out-of-the-box security role should you assign to the user?

A. Environment Admin

B. Basic User

C. Environment Maker

D. System Customizer

Suggested Answer: *C*
The Environment Maker can create new resources associated with an environment, including apps, connections, custom APIs, gateways, and flows using Microsoft Power Automate. However, this role doesn't have any privileges to access data within an environment (but this user has this already according to the question). Incorrect: Not Environment Admin: Theɔ€‰Environment Adminɔ€‰role can perform all administrative actions on an environment. Not System Customizer: Has full permission to customize the environment. However, users with this role can only view records for environment entities that they create. Not Basic User: Can run an app within the environment and perform common tasks for the records that they own. Note that this only applies to non-custom entities. Reference: https://docs.microsoft.com/en-us/power-platform/admin/database-security

Community vote distribution
C (75%) D (25%)

LSTR1995 Most Recent 1 year, 4 months ago
Going for C, Environment Maker. The user has already access to the data, its stated in the questions. So A is discarded, B definitely no. Systems Customizer could be a possible option but has additional security privileges
upvoted 1 times

Enzor 1 year, 8 months ago
Selected Answer: D
Environment make doesnt have the permissions to use dataverse, Environment admin has too many rights, so the answer is system customizer
upvoted 2 times

Enzor 1 year, 8 months ago
Environment make doesnt have the permissions to use dataverse, Environment admin has too many rights, so the answer is system customizerShould be C (Environment Maker). User already has access to Dataverse, so granting System Customizer grants access that user already has AND give access to edit entities (that is not requested).
upvoted 2 times

Diezvai 1 year, 5 months ago
Should be C (Environment Maker). User already has access to Dataverse, so granting System Customizer grants access that user already has AND give access to edit entities (that is not requested).
upvoted 1 times

eb60697 2 years ago
1. This is an updated question. It is the same as Question 21 but instead Common Data Service (CDS) database it says Microsoft Dataverse database. CDS was the former name of the Microsoft Dataverse. Also, there is here the option Basic User, that is the new name for the Common Data Service user that is in the question 21. 2. The answer C is CORRECT because: A) although the Environment Maker role doesn't have privileges on the environment's data, here the question establishes that the user already has access to the database. And B) the question does not mention that the user needs to create or update entities, its requirement is just to create apps. So the user does need to have access to data, but not necessarily customize anything
upvoted 4 times

itenginerd 2 years, 2 months ago
Y'all are killing me with the System Customizer bit. Yes, you need that role to access the data. On the other hand: "A user has access to an existing Microsoft Dataverse database...."
upvoted 2 times

rockyoz 2 years, 4 months ago

Clearly it is D: Resource Environment Maker Environment Admin System Customizer System Admin Canvas app X X X X Cloud flow X (non–solution-aware) X X X Connector X (non–solution-aware) X X X Connection* X X X X Data gateway X X - X Dataflow X X - X Dataverse tables - - X X

upvoted 1 times

jmccolly 2 years, 4 months ago

D: System Customizer -From MS Learn- Users who make apps that connect to Dataverse and need to create or update table and security roles need to be assigned the System Customizer role in addition to the Environment Maker role. This is necessary because the Environment Maker role doesn't have privileges on the environment's data.

upvoted 1 times

hismail 2 years, 8 months ago

in my opinion, it's not C because the Environment Maker role does not have any privileges to access data within an environment. This means that the user cannot consume data from Dataverse, even if they have access to the existing database. The user needs a security role that gives them read and write access to the data, such as the System Customizer role. The Environment Maker role can only create and customize apps, connections, custom APIs, gateways, and flows using Microsoft Power Automate

upvoted 1 times

rijamg 2 years, 10 months ago

B. Basic User To allow a user to create canvas apps that consume data from Dataverse without granting unnecessary permissions, you should assign the "Basic User" security role. This role provides the necessary access for app creation and data consumption without granting extensive administrative privileges. The other roles, such as Environment Admin, Environment Maker, and System Customizer, typically have broader access and control over the environment, which may not be required for the user's purpose of creating canvas apps.

upvoted 1 times

Radoslavov 3 years, 5 months ago

Same as question 21 but instead of CDS is says Dataverse

upvoted 2 times

Ikhalil 3 years, 5 months ago

C is correct

upvoted 1 times

DimpleG 3 years, 10 months ago

Environment Maker: Can create new resources associated with an environment, including apps, connections, custom APIs, gateways, and flows using Microsoft Power Automate. However, this role doesn't have any privileges to access data within an environment. More information: Environments overview Environment makers can also distribute the apps they build in an environment to other users in your organization. They can share the app with individual users, security groups, or all users in the organization https://learn.microsoft.com/en-us/power-platform/admin/database-security

upvoted 3 times

allesglar 3 years, 10 months ago

upvoted 1 times

kangtamo 3 years, 10 months ago

I think C is the answer.

upvoted 1 times

Christian1983 3 years, 11 months ago

The first sentence of the question is "A user has access to an existing Microsoft Dataverse database". So, I think it´s "Environment Maker" because the privilleg to access the Dataverse data is already existing in this situation.

upvoted 3 times

Daniel_Lee 3 years, 11 months ago

It seems to me C. Can a user have access to a database and does not have permission to read? It seems the following is trying to say that the user has already read-permission. "A user has access to an existing Microsoft Dataverse database." If consume means only read-permission, it is already granted to the user.

upvoted 3 times

MARIANA123 3 years, 11 months ago

"You need to ensure that the user can create canvas apps that consume data from Dataverse." - While they need to be an Environment Maker, without System Customizer role they will not have privileges on the environment's data.but it says "A user has access to an existing Microsoft Dataverse database.". C is correct.

upvoted 1 times

MARIANA123 3 years, 11 months ago

Selected Answer: D

"You need to ensure that the user can create canvas apps that consume data from Dataverse." - While they need to be an Environment Maker, without System Customizer role they will not have privileges on the environment's data.

Edorst 3 years, 11 months ago

but it says "A user has access to an existing Microsoft Dataverse database.". C is correct.

upvoted 2 times

bitsq 3 years, 11 months ago

The correct answer is C and D (mainly D). According to docs: For users who make apps that connect to the database and need to create or update entities and security roles, you need to assign the System Customizer role in addition to the Environment Maker role. This is necessary because the Environment Maker role doesn't have privileges on the environment's data. https://docs.microsoft.com/en-us/power-platform/admin/database-security#predefined-security-roles%20https://docs.microsoft.com/en-us/powerapps/maker/canvas-apps/data-platform-create-app

upvoted 2 times

DRAG DROP -

You are configuring Microsoft Dataverse security. You plan to assign users to teams.

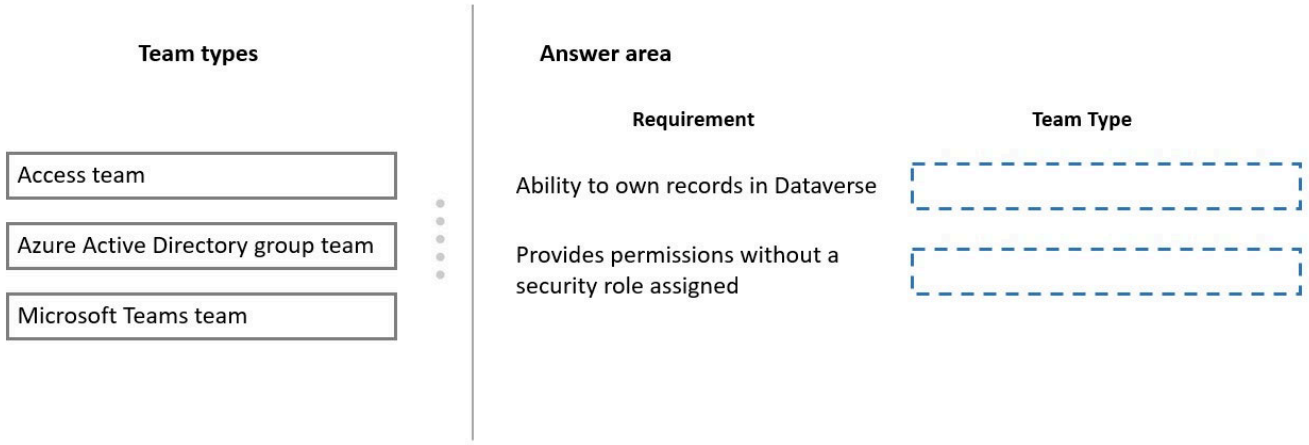
Record ownership and permissions will differ based on business requirements.

You need to determine which team types meet the requirements.

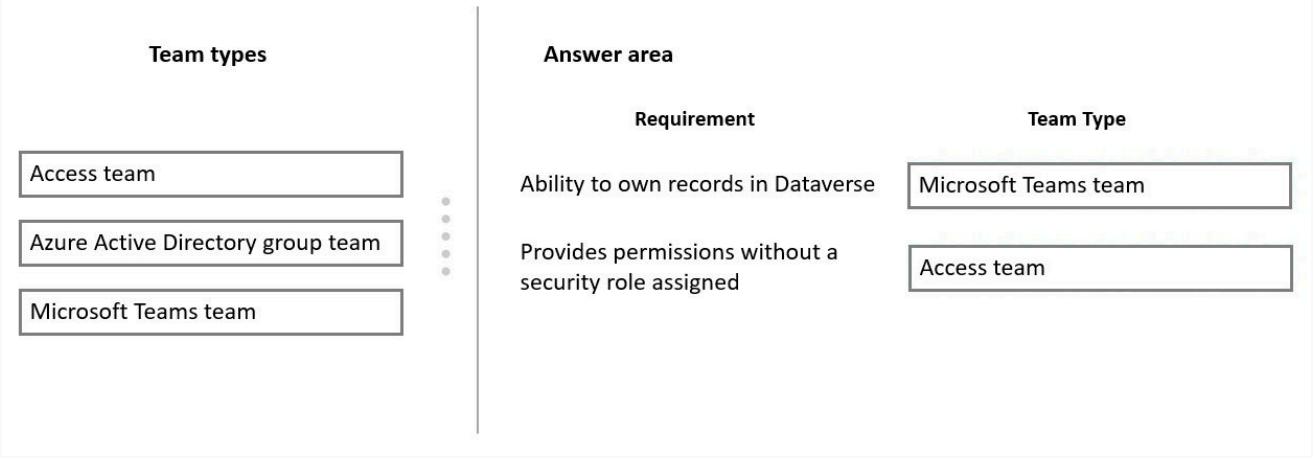
Which team type should you use? To answer, drag the appropriate team types to the correct requirements. Each team type may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

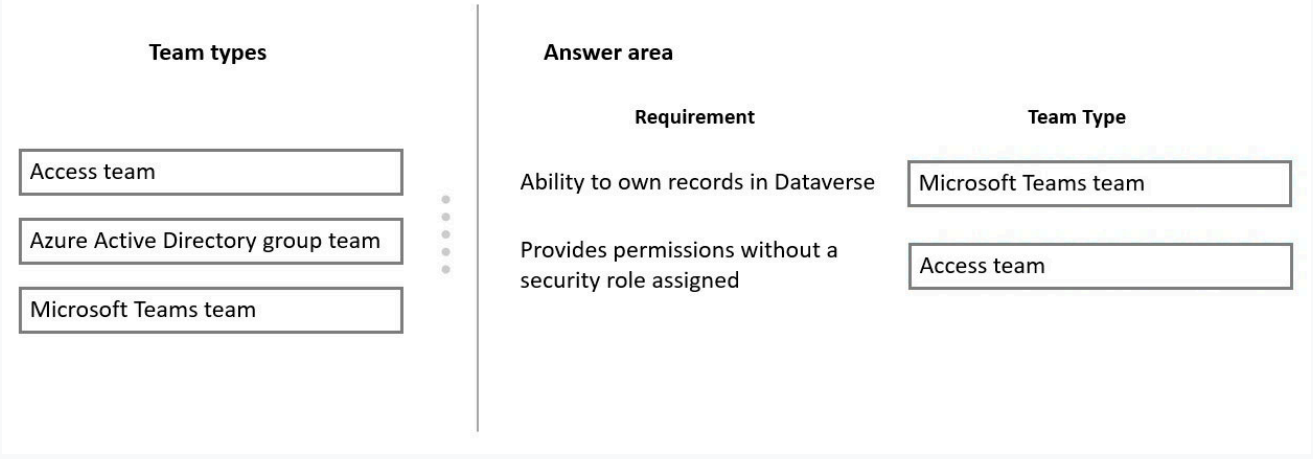
NOTE: Each correct selection is worth one point.

Select and Place:



Suggested Answer:





Box 1: Microsoft Teams team - Dataverse supports two types of record ownership. Organization owned, and User or Team owned. This is a choice that happens at the time the table is created and can't be changed. For security purposes, records that are organization owned, the only access level choices is either the user can do the operation or can't. For user and team owned records, the access level choices for most privileges are tiered Organization, Business Unit, Business Unit and Child Business Unit or only the user's own records. That means for read privilege on contact, I could set user owned, and the user would only see their own records.

Box 2: Access team - An access team doesn't own records and doesn't have security roles assigned to the team. The team members have privileges defined by their individual security roles and by roles from the teams in which they are members. The records are shared with an access team and the team is granted access rights on the records, such as Read, Write or Append. Question #36 *Topic 1*

A company has locations in the United States, Brazil, India, and Japan. The company conducts financial transactions in all of these regions.
Financial transactions in Brazil are going to stop, but the office will remain open.
Users must no longer be able to create records associated with the Brazilian currency. Historical records must remain intact.
You need to configure Microsoft Dataverse to meet the requirement
What should you do?

A. Disable the Brazilian language pack.

B. Rename the Brazilian currency.

C. Delete the Brazilian currency record.

D. Deactivate the Brazilian currency record.

Suggested Answer: *D*
You can't delete currencies that are in use by other records; you can only deactivate them. Deactivating currency records doesn't remove the currency information stored in existing records, such as opportunities or orders. However, you won't be able to select the deactivated currency for new transactions. Reference: https://docs.microsoft.com/en-us/power-platform/admin/manage-transactions-with-multiple-currencies

HOTSPOT -

You are setting up Power Apps security for a company. The company has a CEO, two vice presidents, and 10 managers. Five support representatives report to each manager.

You set up Manager Hierarchy so managers are able to view data only for the representatives who report to them. The CEO must be able to view all data for everyone. All support representatives must be able to view customer information in each other's data across all managers.

You need to resolve issues that arise during testing.

What should you do? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

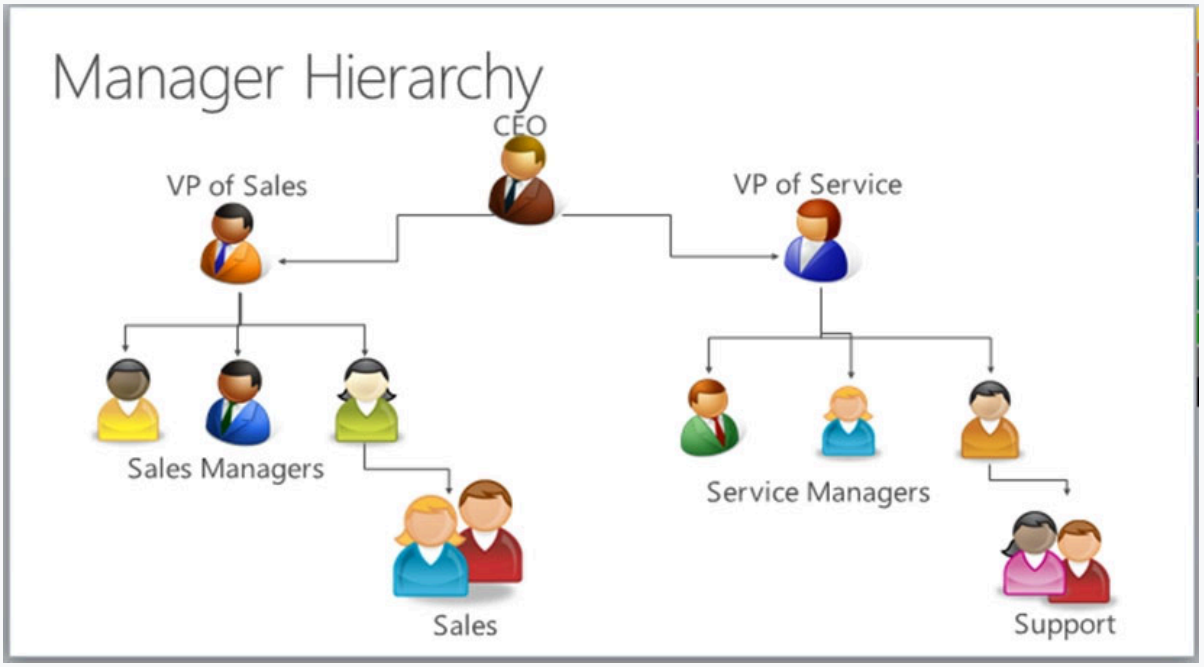
Answer Area

Issue	Action
Managers are unable to view all their report data.	Add the manager's name to the representative's user record. Change the Manager Hierarchy depth to 2. Move the manager and reports to a separate business unit. Set up a position in hierarchy.
The CEO is unable to view representative data but can view manager data.	Add the CEO to the representative user record as a manager. Change Manager Hierarchy depth to 3. Create team security.
Five support representatives can view only their own data.	Add the manager's name to the representative's user record. Add users to field security. Set up a position hierarchy.

Suggested Answer:

Answer Area

Issue	Action
Managers are unable to view all their report data.	Move the manager and reports to a separate business unit.
The CEO is unable to view representative data but can view manager data.	Add the CEO to the representative user record as a manager.
Five support representatives can view only their own data.	Add users to field security.



Answer Area

Issue	Action
Managers are unable to view all their report data.	Move the manager and reports to a separate business unit.
The CEO is unable to view representative data but can view manager data.	Add the CEO to the representative user record as a manager.
Five support representatives can view only their own data.	Add users to field security.

Box 1: Move the manager and reports to a separate business unit. Keep the Manager hierarchy, and put the reports to the appropriate business unit. Note: Two security models can be used for hierarchies, the Manager hierarchy and the Position hierarchy. With the Manager hierarchy, a manager must be within the same business unit as the report, or in the parent business unit of the report's business unit, to have access to the report's data. The Position hierarchy allows data access across business units. If you are a financial organization, you may prefer the Manager

hierarchy model, to prevent managers' accessing data outside of their business units. However, if you are a part of a customer service organization and want the managers to access service cases handled in different business units, the Position hierarchy may work better for you. Box 2: Add the CEO to the representative user record as a manager. Set up Manager and Position hierarchies The Manager hierarchy is easily created by using the manager relationship on the system user record. You use the Manager (ParentsystemuserID) lookup field to specify the manager of the user. Incorrect: Not Change the Manager Hierarchy depth to 3: Depth of 3 not required. Depth 2 is ok. Note: Depth is used to limit how many levels deep a manager has Read-only access to the data of their reports. For example, if the depth is set to 2, the CEO can see the data of the VP of Sales, VP of Service and Sales and Service Managers. However, the CEO doesn't see the Sales data or the Support data.

Box 3: Add users to field security Power Platform's field-level security lets you set which fields users can see or edit. Reference: https://docs.microsoft.com/en-us/power-platform/admin/hierarchy-security https://docs.microsoft.com/en-us/power-platform/admin/field-level-security

AdyK Highly Voted 3 years, 11 months ago

Correct answers. 1. Add the manager's name to the representative's user record. (The question should say "reports"') 2. Change Manager Hierarchy depth to 3. 3. Setup a position hierarchy. (This is the only option that lets you view records owned by users in other business units besides if the record is shared.)I agree about 1 and 2, but about 3, I think the answer is security field. The question is about manager hierarchy and not position one. Note While the hierarchy security model provides a certain level of access to data, additional access can be obtained by using other forms of security, such as security roles. https://learn.microsoft.com/en-us/power-platform/admin/hierarchy-securityUser want to see all data Not Secured fields. so for 3rd security fields is wrong. If we add the manager to this users then Manager will able to see the data. which is not we want. Last will be setup a security hierarchy.

upvoted 56 times

Nyanne 3 years, 11 months ago

For box 3, I don't think the provided answer is correct.

Field security will only provide access to fields that have been restricted by field security, on records which they already have access to. The content makes no mention of restricted fields. Field security will not provide users access to records which they do not have access to.

The answer can't be position hierarchy either, as you can only enable 1 hierarchy model at a time, not both manager and position hierarchy.

upvoted 1 times

Rod_Beka 3 years, 9 months ago

I do believe you can have both models applied. My answer would be to set up a position Hierarchy. "In the following example, the sales person reports to the sales manager in the Manager hierarchy and also has the Sales position in the Position hierarchy " - Extracted from: https://learn.microsoft.com/en-us/power-platform/admin/hierarchy-security#position-hierarchy

upvoted 2 times

Nyanne 3 years, 11 months ago

For box 2, I think the specified answer is incorrect. I believe the correct answer is option 2 'Change hierarchy depth to 3'. If the relationship depth is set to 3, then the CEO would have edit privileges to the VP users data, and read level privileges to the manager and support reps data. As outlined in the documentation: https://learn.microsoft.com/en-us/power-platform/admin/hierarchy-security#manager-hierarchy Setting up the Sales Representative's manager to the CEO would be incorrect... The Sales Representative's manager should be set to their Sales Manager, and the Sales Manager's manager the VP, the VP's manager the CEO...

upvoted 3 times

Nyanne 3 years, 11 months ago

With box 1, I would choose option 1: "Add the managers name to the representatives user record." Since the manager needs to be able to see data from the representatives that report to them, if the data from sales reps are not available, then perhaps the hierarchy relationship to the manager has not been setup on the user record...

Question #38 *Topic 1*

You are embedding a Power Apps visual in a Power BI dashboard.
External customers must authenticate to have access to the dashboard.
You need to configure the solution.
Which two actions should you perform? Each correct answer presents part of the solution.
NOTE: Each correct selection is worth one point.

A. Set the Power BI service to authenticate users.

B. Use a table in the Power BI dashboard.

C. Publish to Power BI Report Server.

D. Set the Power BI service to allow anonymous access.

E. Share the Power Apps visual components with external users.

Suggested Answer: *A, E*
A: Power BI uses Azure Active Directory (AAD) to authenticate users who sign in to the Power BI service, and in turn, uses the Power BI login credentials whenever a user attempts to access resources that require authentication. Users sign in to the Power BI service using the email address used to establish their Power BI account; Power BI uses that login email as the effective username, which is passed to resources whenever a user attempts to connect to data. The effective username is then mapped to a User Principal Name (UPN) and resolved to the associated Windows domain account, against which authentication is applied. Incorrect: Not D: Not allow anonymous access as authentication required. Reference: https://docs.microsoft.com/en-us/power-bi/enterprise/service-admin-power-bi-security

A and B are the actions that should be performed. A. Set the Power BI service to authenticate users: This is necessary to ensure that only authorized users can access the dashboard. You can configure authentication using Azure Active Directory (AAD) or other authentication providers. B. Use a table in the Power BI dashboard: Using a table in the Power BI dashboard allows you to control access to the embedded Power Apps visual. You can use Row-Level Security (RLS) to limit access to specific rows of data within the table.

Question #39 *Topic 1*

Your organization does not permit the use of custom code for solutions.
You need to create a view that can be viewed by all users in an organization.
Where should you create the view?

A. Advanced Find

B. Entities component of a solution

C. Microsoft Excel template

D. System Settings

Suggested Answer: *B*
Entity: Refers to a table in Dataverse. Table and entity are often used interchangeably for data access. Edit public views through tables 1. In the solution create a new table or find an existing table that where the public views need to be edited. 2. Expand Data, select Tables, select the table you want, and then select the Views area. 3. On the toolbar, select Add view. Add view to table 4. On the Create a view dialog, enter a name and, optionally, a description, and then select Create. Reference: https://docs.microsoft.com/en-us/power-apps/maker/model-driven-apps/create-edit-views-app-designer

Question #40 *Topic 1*

HOTSPOT -

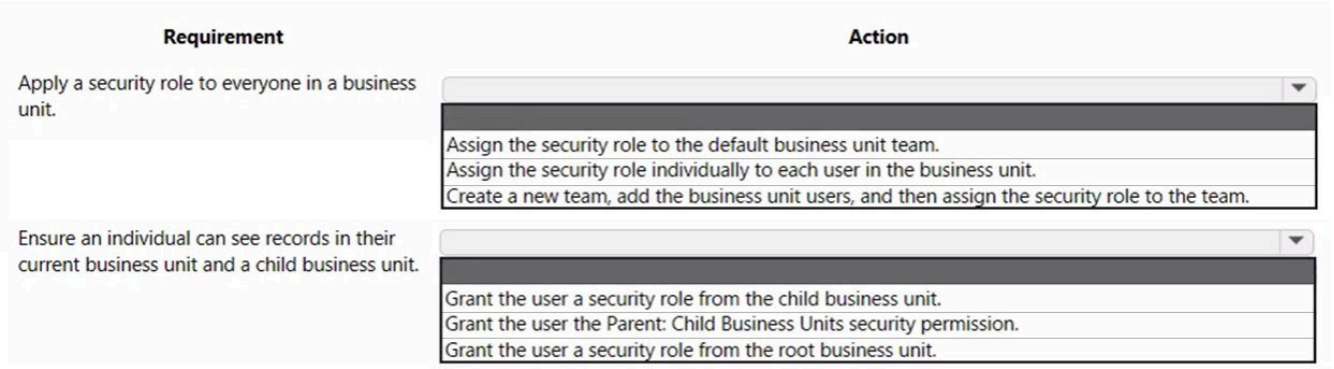
You are designing the organization structure for a company that has 5,000 users.

You need to configure security roles for the company while minimizing administrative effort.

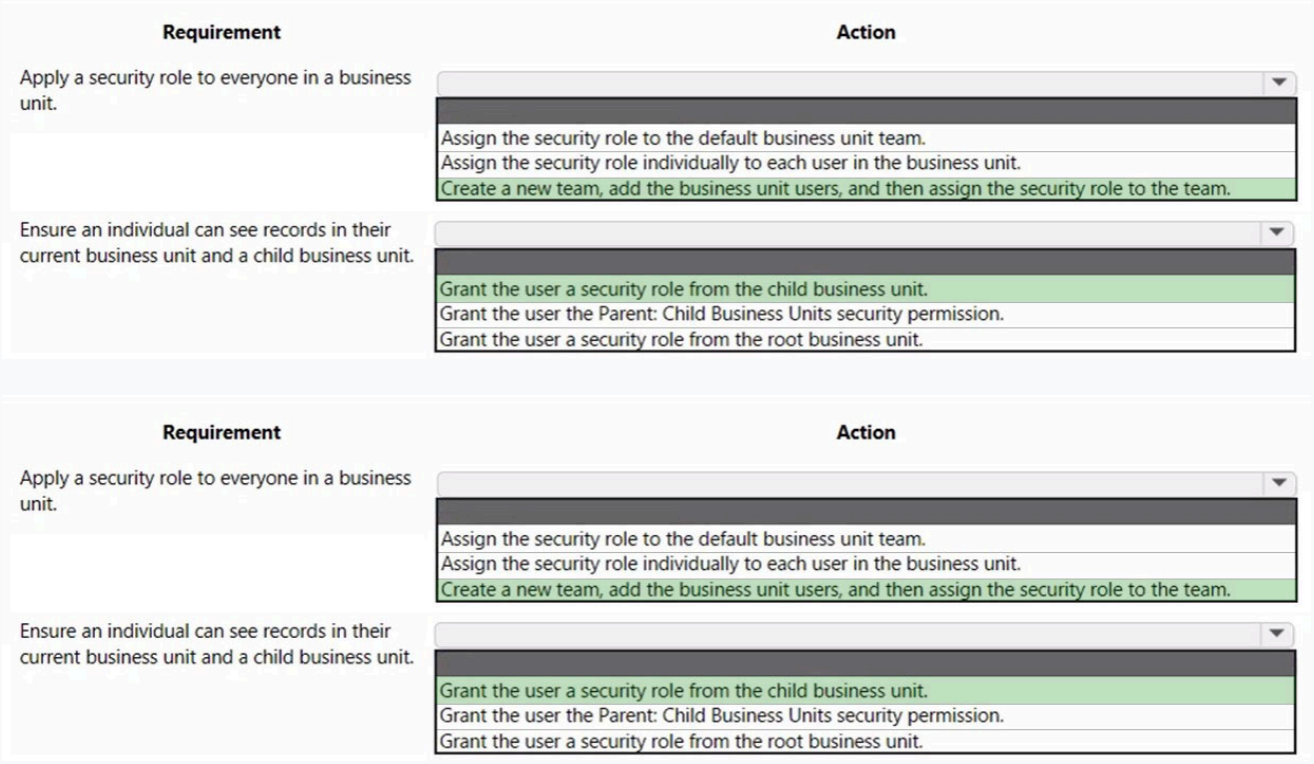
What should you do? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:



Suggested Answer:



Box 1: Create a new team, and the business unit users, and the assign the security role to the team. Change the business unit for a team

Important - By changing the business unit for a team, you can remove all security role assignments for the team. At least one security role must be assigned to the team in the new business unit. 1. Select an environment and go to Settings > Users + permissions > Teams. 2. Select the checkbox for a team name. 3. Screenshot selecting a team. 4. On the menu bar, select Change Business Unit. 5. In the Change Business Unit dialog box, select a business unit. Enable Move records to new business unit to move to a new business unit. Select OK. Box 2: Grant the user a security role from the child business unit. Incorrect: * Grant the user the Parent: Child Business Units security permission. Too much permissions granted. The application refers to this access level as Parent: Child Business Units. This access level gives a user access to records in the user's business unit and all business units subordinate to the user's business unit. * Grant the user a security role from the root business unit. Too much permissions granted. Reference: https://docs.microsoft.com/en-us/power-platform/admin/create-edit-business-units https://docs.microsoft.com/en-us/power-platform/admin/security-roles-privileges

Dotzs Highly Voted 3 years, 4 months ago

Answer is:

Box 1 - 1 Box 2 - 2

- The business unit will have a default team, so just assign to roles to it instead of creating a new Team

- Parent: Child can only be assigned as a permission and not a security role, e.g you can give Parent: Child... on create, write, delete... on an entity within a security role.

upvoted 37 times

Dotzs Highly Voted 3 years, 4 months ago

upvoted 9 times

emapedrozo 3 years, 2 months ago

Both are incorrect: For Box 1 the correct answer should be option 1 as the docs claims: "You can assign a security role to the business unit's default team. This is done to simplify security role management where all your business unit team members can share the same data access." And for Box 2, the correct answer should be Option 2, as docs claims: "Deep. This access level gives a user access to records in the user's business unit and all business units subordinate to the user's business unit. Users who have Deep access automatically have Local and Basic access, also. Because this access level gives access to information throughout the business unit and subordinate business units, it should be restricted to match the organization's data security plan. This level of access is usually reserved for managers with authority over the business units. The application refers to this access level as Parent: Child Business Units."

Each business unit has a default team. You can't update the default team's name, nor delete the default team. You can't add or remove users from the business unit's default team. However, you can change the user's current business unit to the new business unit and the user will automatically be added to the business unit's default team. You can assign a security role to the business unit's default team. This is done to simplify security role management where all your business unit team members can share the same data access. https://learn.microsoft.com/en-us/power-platform/admin/create-edit-business-units

MrEz 2 years, 1 month ago

In a setting with sub-sub business units, in the background the system creates several security role records (including the parent root role), each one of them related to a business unit all 3 are wrong a) As it is written I would understand to grant(apply) a user in the A-Team business unit the security role record ‘from’ the sub business unit A1. I would not do that (maybe wit xml edit or any ploy you could manage this). B) I jumped for this solution first but there are 2 reasons why it is down wrong: first, the permissions are granted on roles, not on users (wrong entity!). Second, it is not a permission but an access level. c) Means the opposite from a) give a user e.g. in business unit B-Team the (parent root) role record ‘from’ root business unit CRM... Which answer is the least wrong? The answer B) that has 2 wrong components or one of the others..?

Box 2 - 1 is correct. You need to allow access to just one particular BU. Not all children.

upvoted 1 times

Radoslavov 2 years, 11 months ago

I think the options are correct 1 and 3. If you look a bit deeper to the question it says "5,000 users. You need to configure security roles for the company while minimizing administrative effort" Q1: Apply a security tole to everyone in A business unit (it doesn't specify that this is the root one) So apart of the root BU, if we have another one, we need to create a new team for that BU and assign it to the BU as by default the new BU doesn't have team when was created. So this is the minimum effort to apply a security role to everyone from A BU. Q2: Ensure an individual can see records in THEIR current business unit and a CHILD unit - if i'm the admin, i will use the new functionality "Matrix data access structure" to provide access to a data from another BU by assigning a role from that unit, instead of going to the role in the user's BU and modify the level one-by-one, which will apply for EVERY user in that BU and the question also says "Ensure an individual"ignore this part of my comment: we need to create a new team for that BU and assign it to the BU as by default the new BU doesn't have team when was created. IT IS CREATED ACTUALLY BY DEFAULT AND LINKED TO THE BUso you just need to "Create a new team, add the business unit, and then assign the security role to the team "if the team is created automatically, you just need to assign users to that team, no need to create a new team and add the business unit..", so the answer should be 1st.

LukeB22 3 years, 2 months ago

Box 1 Is very likely the first option: "Every Business Unit has one default team that is automatically created when the Business Unit is created"

If they want to apply the security role to every person in a business unit then this is the fastest and easiest way, Creating a new team is unnecessary

upvoted 1 times

LukeB22 3 years, 2 months ago

Box 1 Is very likely the first option: "Every Business Unit has one default team that is automatically created when the Business Unit is created" If they want to apply the security role to every person in a business unit then this is the fastest and easiest way, Creating a new team is unnecessaryI should also add: "The default team members are managed by Dataverse and always contain all users associated with that Business Unit. You can't manually add or remove members from the default team, they're dynamically adjusted by the system as new users are associated/disassociated with business units." So if you manually make a team and add the members then they will still have the security roles even though they may not be in the business unit anymore!

upvoted 1 times

LukeB22 3 years, 2 months ago

upvoted 2 times

Momo84 3 years, 2 months ago

This is a horrible question. I would say that q1 = a1 and q2 = a1 BUT you can't directly add a security role from another BU, that can only be done by adding the user to a Team from another BU that has a security role applied to it AND you can't add a user to a default BU Team. I think they've made this purposefully confusing.

Question #41 *Topic 1*

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
A company uses Dataverse.
The company plans to store and manage documents and data in the environment. The company requires a solution that minimizes Dataverse storage consumption.
You need to recommend a solution.
Solution: Configure SharePoint on-premises integration.
Does the solution meet the goal?

A. Yes

B. No

Suggested Answer: *B*
Official Answer: B

Community vote distribution

Spectrum128k 1 year, 1 month ago
 Does this meet the goal? . No Why? Dataverse supports SharePoint Online, not SharePoint on-premises, for document management integration. Even if on-prem integration were possible, it's not designed to offload Dataverse storage efficiently. Only SharePoint Online integration with Dataverse natively redirects file attachments (e.g., notes, email attachments) to SharePoint to reduce Dataverse file storage usage. Exam Insight This is one of those questions testing your grasp of cloud-only integrations. Always watch for "on-prem" red herrings — they often don't align with scalable, low-maintenance cloud solutions.

upvoted 1 times

Diezvai 1 year, 5 months ago
Correct (B) - question does not indicate that company has SharePoint on-prem farm. If it had one, then.. maybe - depends on volume of data. Since there is no mention of having one, setting up from zero is very expensive (licence + physical servers + personnel) - it pays off only for large volume in long term
upvoted 1 times

BRIS776 1 year, 5 months ago
A is correct answer. SharePoint can be used as file storage solution and minimize storage cost for Dataverse
upvoted 1 times

Manish_p89 1 year, 5 months ago
Selected Answer: A

Yes, the solution meets the goal.

Here's why: When you configure SharePoint on-premises integration with Dataverse, the documents and data are stored in SharePoint, which is a more storage-efficient solution compared to storing them directly in Dataverse. This is because SharePoint is optimized for document storage and management, while Dataverse is primarily designed for structured data (tables/entities).

upvoted 3 times

Manish_p89 1 year, 5 months ago

Yes, the solution meets the goal. Here's why: When you configure SharePoint on-premises integration with Dataverse, the documents and data are stored in SharePoint, which is a more storage-efficient solution compared to storing them directly in Dataverse. This is because SharePoint is optimized for document storage and management, while Dataverse is primarily designed for structured data (tables/entities).Incorrect. Question did not stated that company has SharePoint on-prem farm. Even if you ignore this fact, licence + server + personnel costs are comparable only at very large amounts of data.

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
On a Contact record, a user creates a Note record that contains the word running.
One week later, the user reports that they cannot find the Contact record associated with the Note record.
You need to find the Note record.
Solution: Use Dataverse Search to search for the word run.
Does the solution meet the goal?

A. Yes

B. No

Suggested Answer: *B*
Instead use Relevance Search. Note: Relevance Search finds matches to any word in the search term in any field in the entity. Matches may include inflectional words, like "stream," "streaming," or "streamed." Question #43 *Topic 1*

You are using the Data import wizard to import records into the account table from a CSV file.
The CSV-to-table mapping is as follows:
➪ The Name column represents the account name and maps to the Account Name column.
➪ The Parent Name column represents the holding company of the account with subsidiaries underneath.
Records that are imported into the table are only related to other records in the file.
You need to configure the import to create the relationship between records.
What should you do?

A. Map Parent Name in the CSV file to the Parent Account column. Select Account Name as the lookup criteria.

B. Map Parent Name in the file to the Parent Account column. Select Parent Account as the lookup criteria.

C. Create an alternate key on the account table by using the Account Name column. Do not map Parent Name in the file.

D. Look up the record IDs of the records in the Parent Account column. Add the record IDs as a new column in the file. Map the new column to the Parent Account column.

Suggested Answer: *D*
Add a new column for the self-referential mapping. Reference: https://docs.microsoft.com/en-us/power-apps/developer/data-platform/import-data

Community vote distribution
A (88%)

Nyanne Highly Voted 3 years, 11 months ago
Selected Answer: A
Answer provided seems incorrect. I choose option A. A. Map Parent Name in the CSV file to the Parent Account column. Select Account Name as the lookup criteria.

Run through this in the system and see the steps match exactly. The important difference between Option A and B is the last step. "Select Account Name as the lookup criteria." This is where you select the column 'Account name' on the Account table, which is referenced via the Parent Account lookup.
upvoted 16 times

Nyanne Highly Voted 3 years, 11 months ago

upvoted 4 times

OldHand1 3 years, 10 months ago
It has to be A, because the records in the file ONLY relate to other records in the file, so how could you look up the ID? It won't have one if its not in the system.

upvoted 9 times

b38ef39 Most Recent 9 months, 2 weeks ago

You are importing related records that exist only within the same CSV file. The Parent Name column refers to another record in the file (the parent account). By mapping Parent Name to the Parent Account field and selecting Account Name as the lookup criteria, the Data Import Wizard can match and link records based on the names provided in the file. This setup allows the wizard to establish parent-child relationships between accounts during import without needing external record IDs or alternate keys.

upvoted 1 times

ewertowskip 1 year, 11 months ago

I am sure it's D. If you worked with Excel/CSV uploads, you know that not using the GUIDs in lookups is a bad idea.

upvoted 1 times

Nuelovo 2 years ago

B. Map Parent Name in the file to the Parent Account column. Select Parent Account as the lookup criteria. I believe it is B, because the concept of lookUp is simply a child table, to be a ble to reference records in another table(the parent table), using ForeignKeys from the child table to relate to corresponding values in the parent table using primary Key. This Table is a "Child table" Like the question stated, "Record imported into the table are only related to other records in the file" hence the table is simply a child table, and the only column/field that make sence to be used as the foreign key, is the "parent Account Name" Again looking at this phenomenon, the "parent name" field is the only tie, to the Parent table. Because Multiple accounts can be linked to ONLY one Parent Holding company.

upvoted 1 times

5f14337 2 years, 1 month ago

A. Correct

upvoted 1 times

rockyoz 2 years, 4 months ago

It is A, just export a table and import by youself

upvoted 1 times

RominaT 2 years, 5 months ago

Correct answer: A. When you select the mapping column (Parent Account) you have to select which is the lookup mapping criteria which is Account Name because it's the name of the holding account

upvoted 2 times

kty 3 years, 1 month ago

The Parent Name column in the CSV file represents the parent account of the account being imported. The Parent Account column in the account table is a lookup field, which means that it can reference another record in the account table. When you import the data, you need to map the Parent Name column in the CSV file to the Parent Account column in the account table. The lookup criteria for the Parent Account column should be the Account Name column. This will ensure that the parent account is correctly linked to the child account.

HOTSPOT -

A company has a sales application that is supported by an Azure SQL database. You are developing a Power Apps app for use by customer service agents.

The app must reference customer data from the sales application. Data in the sales application is constantly changing and must not be replicated in Microsoft

Dataverse.

Some customer data is considered sensitive. You must protect data for specific fields when users view data in the app.

You need to configure table creation for the app.

How should you configure the app? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

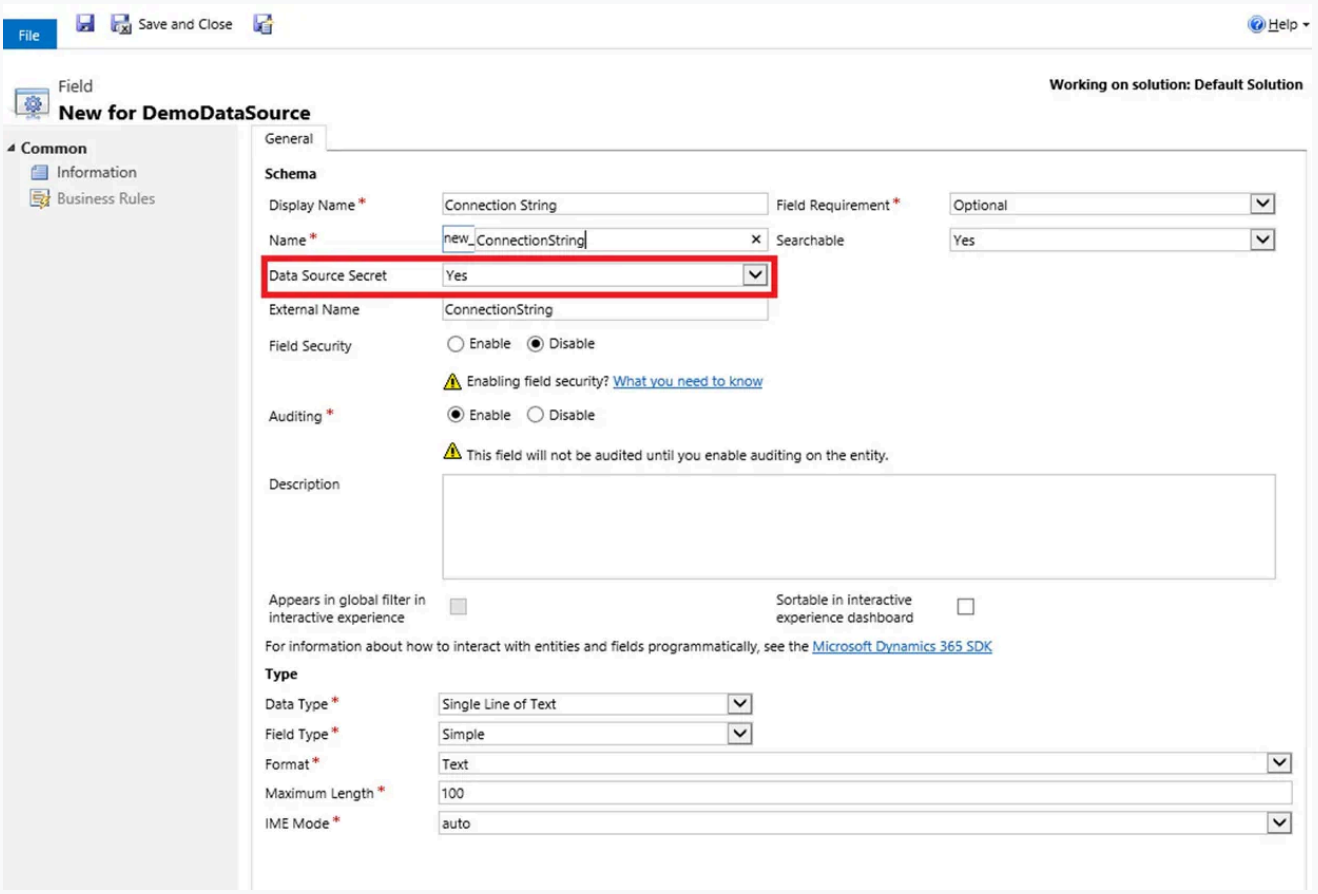
Answer Area

Requirement	Action
Dataverse table type to create for the referenced customer data.	Create a virtual table. Create an activity table. Create a user-owned table. Create an organization-owned table.
Protect sensitive customer data for specific fields.	Create an alternate key. Create a secured column. Implement input method editor (IME) mode. Set the value of the visible property of the fields to false.

Suggested Answer:

Answer Area

Requirement	Action
Dataverse table type to create for the referenced customer data.	Create a virtual table.
Protect sensitive customer data for specific fields.	Create a secured column.



Answer Area

Requirement	Action
Dataverse table type to create for the referenced customer data.	Create a virtual table.
Protect sensitive customer data for specific fields.	Create a secured column.

Box 1: Create a virtual table - A virtual table is a custom table in Microsoft Dataverse that has columns containing data from an external data source. Virtual tables appear in your app to users as regular table rows, but contain data that is sourced from an external database, such as an Azure SQL Database. Rows based on virtual tables are available in all clients including custom clients developed using the Dataverse web services.

Box 2: Create a secured column - Add a secured column to a Data Source You create columns for a Data Source in the same way as any other table. For data that is encrypted or sensitive, enable the Data Source Secret attribute on the custom column of the Data Source.

Reference: https://docs.microsoft.com/en-us/power-apps/maker/data-platform/create-edit-virtual-entities

llc Highly Voted 3 years, 3 months ago
Correct answers are : 1. Create a virtual table. 2. Create a secured column 1 => Because data should not be replicated according to the question. 2 => Some specific fields are more sensible than others so we need column-level security.

I selected "Create a Virtual Table" and "Set the value of the visible property of the fields to false"

For question 1, a virtual table fulfills the requirement of "must not be replicated in Microsoft Dataverse"

For question 2, you would need to do field level security but this is not an option. The requirement is from the perspective of a user, so making a field invisible in the app would fulfill this requirement.
upvoted 5 times

Clubsodas 3 years, 5 months ago

HOTSPOT -

A customer uses Power Apps to view and maintain their contacts that are stored in Microsoft Dataverse.

Several columns must be configured to ensure the security settings for sales associates are view only.

You need to configure the access restrictions.

Which component for field-level security should you use? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

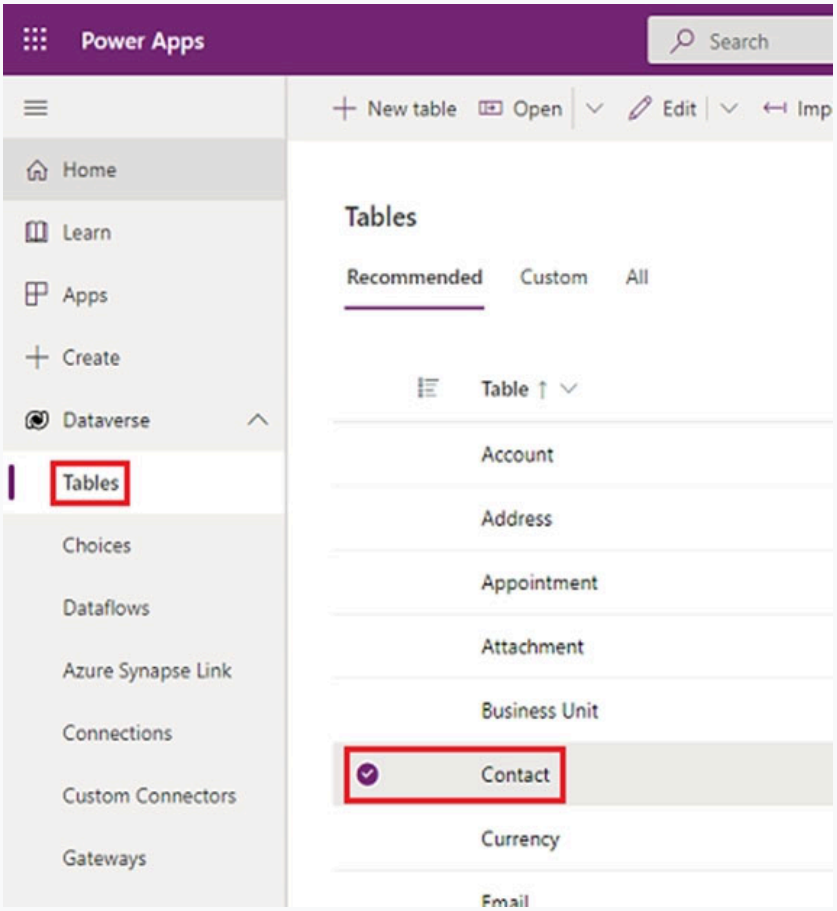
Answer Area

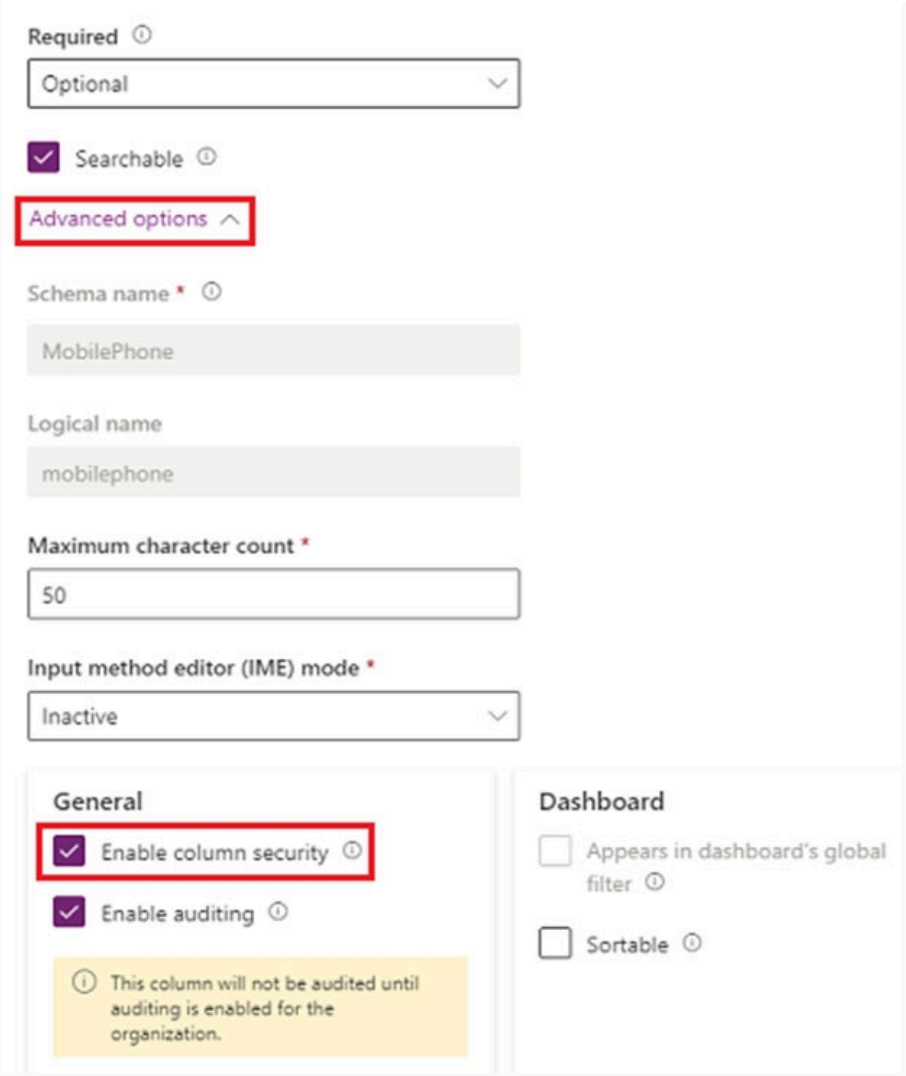
Action	Component
Enable the fields for record-level security.	Azure Data Lake Gen2 Azure SQL Power Apps app designer Microsoft Power Platform admin center
Set the security settings for the sales associates to view only.	Azure Active Directory group team Dataverse table Field Security Profiles User

Suggested Answer:

Answer Area

Action	Component
Enable the fields for record-level security.	Power Apps app designer
Set the security settings for the sales associates to view only.	Field Security Profiles





Answer Area

Action	Component
Enable the fields for record-level security.	Azure Data Lake Gen2 Azure SQL **Power Apps app designer** Microsoft Power Platform admin center
Set the security settings for the sales associates to view only.	Azure Active Directory group team Dataverse table **Field Security Profiles** User

Box 1: Power Apps app designer -

Secure the column. Example - 1. Sign in to Power Apps (The Power Apps website - https//make.powersapp.com) 2. Select Dataverse > Tables. 3. Select the Contact table.

4. Under Schema, select Columns. 5. Expand Advanced options, and then under General, enable Enable column security.

6. Select Save.

Box 2: Field Security Profiles - Configure the security profiles. Example 1. From the Power Platform admin center, select the environment to configure security profiles for. 2. Select Settings > Users + permissions > Column security profiles. 3. Select New Profile, enter a name, such as Sales Manager, enter a description, and then select Save. 4. Select Sales Manager, select the Users tab, select + Add Users, select the users that you want to grant access to the mobile phone number on the contact form, and then select Add. Reference: https://docs.microsoft.com/en-us/power-apps/maker/model-driven-apps/app-designer-overview https://docs.microsoft.com/en-us/power-platform/admin/field-level-security

Clubsodas Highly Voted 3 years, 5 months ago

I select "Power Apps app designer" for question 1 and "Field Security Profiles" for question 2. I tested this in a model-driven app and you can navigate to the tables -> columns and update the setting to "Enable column security". Field Security Profiles are set in security settings and allow you to restrict access to data in a specific field.

upvoted 30 times

llc Highly Voted 3 years, 3 months ago

Correct 1. PowerApps app designer 2. Field security profiles

upvoted 8 times

b38ef39 Most Recent 9 months, 2 weeks ago

1- Microsoft Power Platform admin center This is where you enable field-level security for columns in Dataverse. 2- Field Security Profiles Field Security Profiles allow you to define which users or teams can view, update, or create data in secured fields. For your requirement, you would configure the profile so that sales associates have read-only access.

Question #46 *Topic 1*

DRAG DROP -

You modify a model-driven app for a bicycle repair help desk. The model-driven app is for help desk users when customers have an issue with their bicycle.

After you add a custom table named bicycle, you configure the table for Microsoft Dataverse search. The table will contain information from callers about their bicycles. The account table is related to the custom table. Contact information is brought over to the custom table.

You add the following columns to the table:

- ✑ Bicycle type
- ✑ Tire brand
- ✑ Special equipment

Users must be able to perform the following types of searches:

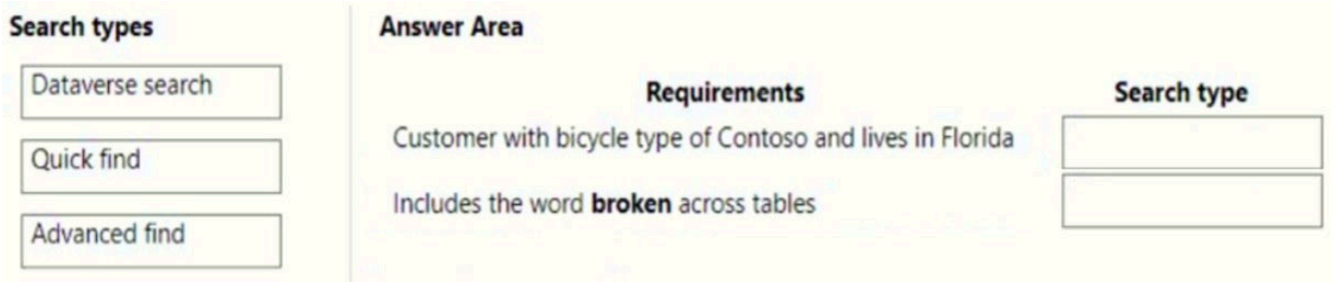
- ✑ Search for all customers who have a bicycle type of Contoso and live in Florida.
- ✑ Search all tables for any record that contains the word broken.

You need to decide which type of search will give you the results desired.

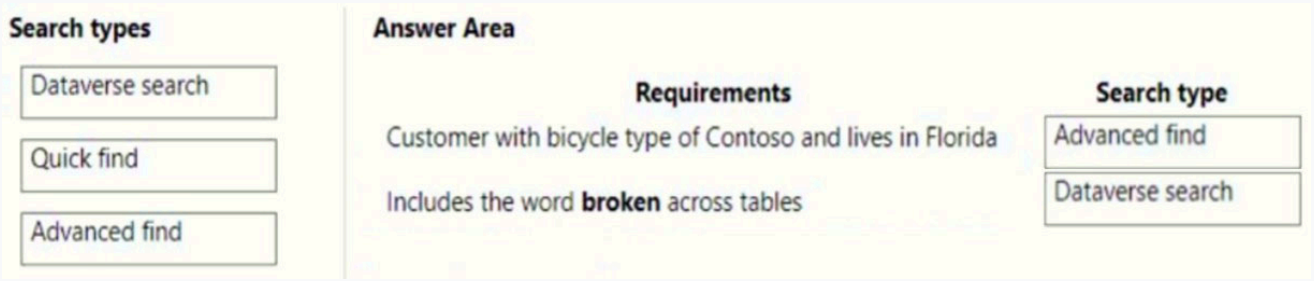
Which search should you configure? To answer, drag the appropriate search types to the correct requirements. Each search type may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Select and Place:



Suggested Answer:



Box 1: Advanced find - Operators for advanced search: Lets you use simple Boolean operators in your search term and craft the query to get the results you want.

Box 2: Dataverse search - Dataverse search helps you quickly find what you're looking for. It delivers fast and comprehensive results across multiple tables in a single list, sorted by relevance. 1. export then reimport 2 & 3. separate component for each language https://learn.microsoft.com/en-us/power-platform/alm/create-solutions-support-multiple-languages

upvoted 1 times

MrEz 2 years, 1 month ago

if you don't have the translations you cannot use them of course. So maybe for 3) it is 'First, export import. Second, use Localized labels aka embedded labels (aka...) depending on the user settings. I guess PowerBI can do this. SSRS... hmm I would never ever use this? So still not clear if 3) is embedded now that I have seen this 1 documentation (before i would have rejected it because the correct term is 'Localized Labels')

upvoted 1 times

MrEz 2 years, 1 month ago

The difficult thing about these questions is the inconsistency of how microsoft uses expressions. I have the impression, microsoft has added more ambiguity adding new or not so hard cut definitions. Basically, in the translation sheet the reference is also here: localized label. https://learn.microsoft.com/en-us/power-apps/maker/data-platform/export-customized-entity-field-text-translation in constrast to that, here, we have 'embedded labels' but it does not say if it can be used in reports. ... Sometimes plural, singular is important, sometimes not. https://learn.microsoft.com/en-us/power-platform/alm/create-solutions-support-multiple-languages: Embedded labels Each of the solution components that use this tactic requires that any localized text be included in the solution component. // is it literally 'embedded'? Embedded into what?

upvoted 2 times

spokoloko 2 years, 1 month ago

If this is about SSRS reports than you could query the users language and then have a dynamic expression inside the "embedded labels" to set different content based on language. You could also create a custom "Report Labels" table and query from there based on the language. Then use the "Lookup" function to get the one appropriate for the report component and users language. Creating a copy of a report and just translating the labels, but becomes messy when you need to do changes to it (and need to repeat it "no of languages" times). So I'm not sure which answer it is."Creating a copy of a report and just translating the labels..." is also an option, probably the only one for people without deeper SSRS skills.

Question #50 *Topic 1*

A company uses Power Apps.
Users must be able to view only the address1 columns in the Account table.
You need to ensure other address columns are not visible to users when creating views and filters.
What should you do?

A. Delete the other address columns from the table.

B. Disable the Search option for the columns.

C. Use column-level security to remove read access to all users.

D. Create business rules to hide the other address columns.

Suggested Answer: *C*
Official Answer: C

C (52%) B (48%)

ShrikrishnaG Highly Voted 3 years, 1 month ago
Correct Answer is C . Please refer this article https://community.dynamics.com/blogs/post/?postid=ffff9d86-c304-4fc7-a5c8-ed47e3e64eb5 , which removes the possibility of answer B , Refer conclusion : Conclusion Setting Searchable property to No, makes the field disappear from the available fields for the Filter configuration, but it won't hide the field when adding columns to the view. This property has no impact on behaviour of the Global and Quick Find Search.Option B, "Disable the Search option for the columns," would not be sufficient in this context. Disabling the search option will only prevent users from using that specific column as a search criterion in the search bar. It does not hide the column entirely from views, filters, or reports. Users would still be able to see the column's data, just not search directly on that column. In contrast, using column-level security to remove read access to all users (option C) effectively makes the column's data invisible to users who don't have the appropriate permissions. This means the data won't appear in views, filters, or reports unless the user has explicit permission to see it, which fits the scenario you've provided much better.

Claude, ChatGPT, and Perplexity agree: C. Use column-level security to remove read access to all users

upvoted 1 times

Ridderxxl 6 months, 1 week ago

When ensuring someone cannot access the values in a column, the solution can only be a column security profile on that column. The rest is noise.

upvoted 1 times

f4b3855 1 year ago

This is correct. Column-level security in Dataverse lets you restrict read, update, and create permissions on specific columns. If you remove read access, users cannot see those columns in views/filters.

upvoted 1 times

skallig 1 year, 6 months ago

It doesn't make sense the answer is B.

upvoted 1 times

DoubleO7 1 year, 6 months ago

Option B only answers second part of question - ensuring it is not visible in search or views. first part of the question - users should be able to see only address1 in table. witch means other addresses shouldn't be visible if you open table directly, thus C is correct as it answers both parts of the question.

upvoted 1 times

Paula0485 1 year, 7 months ago

Correct answer is C - here we're sure users won't access these columns

upvoted 1 times

0521f7a 1 year, 7 months ago

B still allows them to see the column. They just cant search..

upvoted 1 times

killionb12 1 year, 8 months ago

Column-level security allows you to control access to specific columns in a table, ensuring that only authorized users can view or edit those columns. This method is effective in hiding the other address columns from users while still keeping the data intact in the table.

upvoted 2 times

RangelPrime 1 year, 9 months ago

The correct answer is B because it directly meets the question's requirement: hiding additional address columns from views and filters only. Disabling the Searchable option removes these columns from views, filters, and searches, while still allowing access in forms if needed.

Option C (column-level security) would completely block access to these columns everywhere, which is more restrictive than necessary for this scenario. Thus, Option B provides a simpler, more targeted solution.

upvoted 2 times

ABDFormacion 1 year, 9 months ago

A company uses Power Apps. Users must be able to view only the address1 columns in the Account table. You need to ensure other address columns are not visible to users when creating views and filters. What should you do? A. Delete the other address columns from the table. B. Use column-level security to remove read access to all users is the correct solution. It allows for granular control of field-level visibility, ensuring that users only see the address1 fields and cannot access or filter the other address columns.

upvoted 1 times

RaviA 1 year, 10 months ago

Validated in system - Disabling Search option on column still shows column in Advance find. So Correct answer is C

upvoted 3 times

5f14337 2 years, 1 month ago

The correct answer is C. Use column-level security to remove read access to all users. Column-level security in Power Apps allows you to control who has access to view data in specific columns. By removing read access to the other address columns for all users, you can ensure that these columns are not visible when users are creating views and filters. This does not delete the columns or affect their functionality, it simply hides them from users who do not have the necessary permissions.

upvoted 1 times

gina_the_boss 2 years, 1 month ago

can't be C because of the "all users", otherwise both could be correct. so B is correct

upvoted 1 times

Enable Column Security: Sign in to Power Apps. Select Dataverse > Tables. Choose the relevant table. Under Schema, click Columns. In the Columns list, select the desired column. Expand Advanced options, and then under General, enable or disable Enable column security1. Configure Security Profiles: Create one or more security profiles to manage access permissions. Each profile can grant different permissions at the column level: Read: Read-only access to the column's data. Create: Users or teams can add data to this column when creating a row. Update: Users or teams can update the column's data after it has been created. Assign these profiles to specific users or teams based on your requirements.

upvoted 1 times

b304b2c 2 years, 3 months ago

Any users not defined in these profiles won't have access to the column. https://learn.microsoft.com/en-us/power-platform/admin/field-level-security Read last sentence in Configure column permissions.

Question #51 *Topic 1*

DRAG DROP

-

A company uses Power Apps.

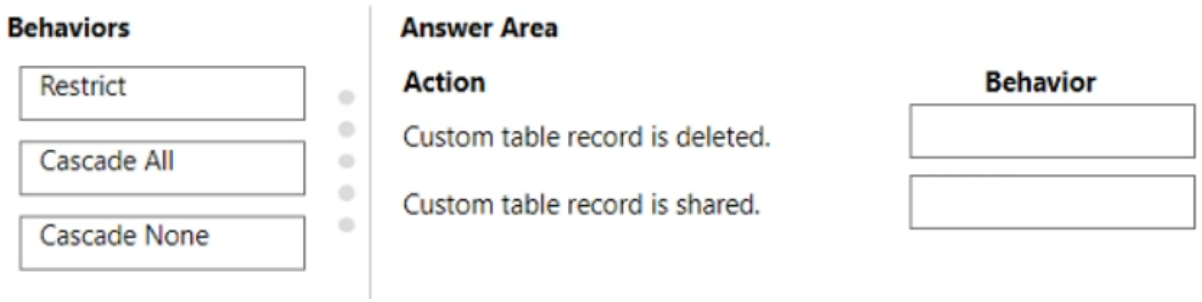
You create a custom table and configure a child table relationship with the contact table.

You need to configure the cascading rules for each action.

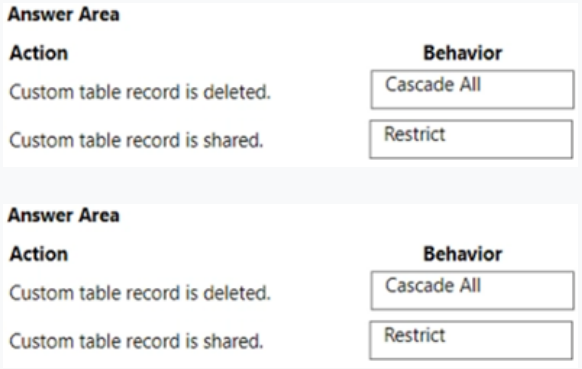
Which behavior should you use? To answer, drag the appropriate behaviors to the correct actions. Each behavior may be used once, more than once, or not at all. You may need to

drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.



Suggested Answer:



RavinBrissy Highly Voted 3 years, 5 months ago

Another stupid question. Why would you delete a related contact when deleting a custom table record, and why you wouldn't ?. Actually the answer will depend on above context. Which doesn't say in the question (must be in mind of the person who wrote it)

https://learn.microsoft.com/en-us/power-apps/maker/data-platform/create-edit-entity-relationships look at the parental table... its cascade for all

upvoted 11 times

ef1336e Most Recent 4 months, 1 week ago

Use Restrict for Custom table record is deleted, and Cascade All for Custom table record is shared. Restrict prevents the parent record from being deleted if related child records (contacts) exist. This protects data integrity by blocking deletion unless all child records are removed first. Cascade All propagates the share action down to all related child records. When the custom table record is shared with a user/team, that sharing cascades to all associated contact records automatically.

upvoted 1 times

05e3903 1 year, 1 month ago

Since the question is about what happens in the child table (not the parent table), the only options are: - Delete: Cascade All - Share: Cascade All https://learn.microsoft.com/en-us/power-apps/maker/data-platform/create-edit-entity-relationships#parental-table-relationships See the column for "Parental".

upvoted 1 times

businesselements1 1 year, 6 months ago

Custom table record is deleted → Cascade All This ensures that when a parent record (contact) is deleted, all related child records in the custom table are also deleted automatically. Custom table record is shared → Cascade None This means that when a parent record is shared, it does not affect the child records. The child records maintain their existing permissions and are not automatically shared.

upvoted 1 times

MVPConsultant 2 years ago

This question is missing context i.e what do you want the use case to be? then we can point it to the correct behaviour as far as i'm aware there is 6 table behaviours that exist. 1. Cascade active: Perform action on all related table records. 2. Cascade all: Perform action on related table records 3. Cascade non: Do nothing 4. Remove link: Remove the lookup value from all related records 5. Restrict: Prevent the primary table from being deleted when a related table record exist. 6. Cascade user owner: Perform action on all related table records owned by the same user as the primary table.

upvoted 5 times

b304b2c 2 years, 3 months ago

1. Restrict 2. Cascade None

https://learn.microsoft.com/en-us/power-apps/maker/data-platform/create-edit-entity-relationships If custom table is Not Parental, then it's Restrict and Cascade None. For example, if you create a new custom table and add a 1:N table relationship with the account table where your custom table is the related table, you can configure the actions for that table relationship to use the options in the Parental column. If you later add another 1:N table relationship with your custom table as the referencing table you can only configure the actions to use the options in the Not Parental column. One problem I have is this: A custom table can't be the primary table in a relationship with a related system table that cascades. This means you can't have a relationship with any action set to Cascade All, Cascade Active, or Cascade User-Owned between a primary custom table and a related system table. Not sure if the table is a system table that cascades?

upvoted 2 times

jkaur 2 years, 4 months ago

just saw custom table is deleted / shared. non-sense question

upvoted 1 times

MrEz 2 years, 7 months ago

Assuming that the custom is the child from the contact (parent), because you configure a child table relationship from there with to the (parent) account (while you are in the custom entity). Most probable scenario. As remove link is not an option: 1) deleted - restrict. 2)sharing: parental is Cascade all. (https://learn.microsoft.com/en-us/power-apps/maker/data-platform/create-edit-entity-relationships#parental-table-relationships cascade non is not-parental). And it is more a priviledge discussion... A custom table can't be the primary table in a relationship with a related system table that cascades. This means you can't have a relationship with any action set to Cascade All, Cascade Active, or Cascade User-Owned between a primary custom table and a related system table. --> would mean you cannot make a structure like house (account), household(custom), and contact? sort of strange. 3/3

upvoted 2 times

MrEz 2 years, 7 months ago

The question also is which entity is parent and which one is child, reading “You create a custom table and configure a child table relationship with the contact table.” Sounds a bit like the custom is parent and the contact is child relationship. But this sounds odd (maybe you have some scenario where account is the house, custom entity is household (many households in 1 account(house), and many contacts in 1 household.). Or is the custom table

the child record and the contact is the parent? not sure. One-to-many custom -> Contact works with referential and delete restrict or remove link as an option only (creation works). 2/3

literally you can understand it either way and it still sounds right. I wish I could have a talk with the person who wrote the question!

upvoted 1 times

MrEz 2 years, 7 months ago

I think this answer is wrong. Because when I want to create a One-to-Many relationship from Custom to Contact (contact lookup field). for share and unshare option 'restrict' is not available just: Cascade All Cascade Active Cascade User-Owned Cascade None For parental and Custom (Delete cascade all) i get an error: Contact is parented to entity with id... (probably account) and name contact. Cannot create another parallel relation with Entity: custom entity. No new relationship can have any action set to Cascade All, Cascade Active, or Cascade User-Owned if the related table in that relationship already exists as a related table in another relationship that has any action set to Cascade All, Cascade Active, or Cascade User-Owned. This prevents relationships that create a multi-parent relationship. (1/2)

upvoted 1 times

hismail 2 years, 8 months ago

1- Customer table record is deleted: A- Restrict This will prevent the customer table record from being deleted if there are any related records in the contact table. This will preserve the data integrity and avoid orphaned records. 2- Custom table record is shared: B- Cascade All This will share the custom table record with the same users or teams as the contact table record. This will ensure consistent access and visibility across the related records.

Question #52 *Topic 1*

You plan to add a Power Apps app to Microsoft Teams.
A Microsoft Dataverse for Teams environment has not been provisioned.
You need to create a Dataverse for Teams environment.
Which two actions can you perform? Each correct answer presents a complete solution.
NOTE: Each correct selection is worth one point.

A. Create a new app in Teams.

B. Install an existing app in Teams.

C. Create a new environment in the Microsoft Power Platform Admin Center.

D. Create an app permission policy in the Teams admin center.

Suggested Answer: *A, B*
Official Answer: AB

Community vote distribution
AB (70%) AC (30%)

5f14337 Highly Voted 2 years, 1 month ago
To create a Dataverse for Teams environment, you can perform the following actions: A. Create a new app in Teams. When you create a new app in Teams, a new Dataverse for Teams environment is automatically provisioned if one does not already exist. This environment is where the app's data will be stored. C. Create a new environment in the Microsoft Power Platform Admin Center. You can manually create a new Dataverse for Teams environment from the Power Platform Admin Center. However, this requires administrative privileges. Please note that options B and D do not directly contribute to the creation of a Dataverse for Teams environment. Installing an existing app in Teams (Option B) would require an existing environment, and creating an app permission policy in the Teams admin center (Option D) pertains to controlling access to apps rather than creating new environments.
upvoted 7 times

nessus Most Recent 1 year, 3 months ago
Dataverse for Teams environments are automatically created for the selected team when you create an app in Teams using the app for the first time or install an app from the app catalog.

ChatGPT

The correct answers are A and C.

Explanation: To create a Dataverse for Teams environment, the following actions can be performed:

A. Create a new app in Teams: This will automatically create a Dataverse for Teams environment associated with the app.

C. Create a new environment in the Microsoft Power Platform Admin Center: This will create a new Dataverse for Teams environment, which can then be associated with a Teams app.

B. Installing an existing app in Teams will not create a new Dataverse for Teams environment. It will only add the app to an existing environment.

D. Creating an app permission policy in the Teams admin center will not create a new Dataverse for Teams environment. It is used to control access to apps in Teams.

To delete audit data in a Microsoft Dataverse database, you can use the following three methods: By Record: You can delete the change history for a specific record using the DeleteRecordChangeHistoryRequest. This method allows you to target and remove audit data for individual records. Between Two Specified Dates: You can delete audit data within a specific date range using the DeleteAuditData message. This is useful for clearing out audit logs that fall within a particular timeframe. Older Than a Specified Date: You can delete audit data that is older than a certain date. This helps in managing and reducing the volume of historical audit data that is no longer needed.

To ensure that duplicate records are deleted without user intervention during the data import process in Microsoft Dataverse, you should configure the following option: A. Enable the During data import option. Here's why: Enabling the "During data import" option in the duplicate detection rule ensures that duplicates are identified and managed automatically when records are imported into Dataverse. This prevents duplicates from being created in the first place and automates the process without requiring user intervention.
upvoted 1 times

61be873 2 years, 4 months ago
A During data import When you use the Import Data wizard to bring in contacts, leads, accounts, or other types of data, the wizard detects any duplicate records as long as you enable duplicate detection in the wizard. For more information, see Import data from multiple sources.

upvoted 1 times

spokoloko 2 years, 7 months ago

"You need to configure the rule for the data import" None of the answers is correct. You need to: 1. Enable duplicate detection during import globally in the duplicate detection settings (not on a specific rule). 2. Not touch the default "No" on "Allow Duplicates" on the last step of the data import wizard. None of these is on the rule itself.

upvoted 1 times

Joey444 2 years, 9 months ago

A) During data import. You can specify whether or not to check for duplicates during the import. https://learn.microsoft.com/en-us/power-platform/admin/detect-duplicate-data

upvoted 1 times

Sid223344 2 years, 10 months ago

I initially thought the answer was C but I think it is A as per the following document: https://learn.microsoft.com/en-us/power-platform/admin/import-data-all-record-types. It states: You can import data from various systems and data sources into standard and customized columns of most business and custom tables. You can include related data, such as notes and attachments. To assure data integrity, you can enable duplicate detection that prevents importing duplicate records.

Another poorly worded question. Both A and C are correct in my opinion. So it depends what the question person had in mind... A - if you are configuring duplicate rules at Organisation level C - if you are doing it in the Import Data Wizard. (Allow duplicates is set to 'No' by default, so technically, so no user intervention is required there either...)

correct

upvoted 3 times

spokoloko 2 years, 7 months ago

Bad wording again... "Users need to add an alternate phone number when entering their account information." What is "their account"? This suggest editing a user profile. If a user creates Account/customer records this is not "their account". Also none of the answers prevents the users from creating an Account without an alternative phone number. Question should be: "Users would like to have an option to enter an alternate phone number when creating or updating Accounts."

You create a model-driven app for an automobile parts help desk.

A help desk agent uses a form to gather information about customers' automobiles in two custom tables. The names of the tables are Client and Automobile.

The form must prepopulate the following information about the customer from the client table:

• First name

• Last name

The agent must be able to type the following information about the automobile:

• Automobile make

• Automobile model

You need to implement the form.

What should you configure? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Requirement	Configuration
Prepopulate client information	Dataflow Relationship Alternate key Virtual table
Enter automobile information	Table View Connector Power Automate flow

Relationship Table

upvoted 5 times

61be873 1 year, 10 months ago

1) relationship => lookup Client to Automobile. 2) table (form of Automobile entity / table)

upvoted 5 times

MrEz 2 years, 1 month ago

The interesting thing is that both answers point to external data (which is not part of the question). Most probably automobile industry is a heavily integrated industry (using product information systems.. and more..., not part of the question). Not sure why client (custom, not contact renamed. It says custom.) instead of contact (OOTB) is used. I assumed Client and Automobile would already be existing. But that's my mistake? i would go for: 1) Relationship (virtual table does not pre-populate, it just brings data up, data resides outside). 2) Table (you type into fields adding data to a table. if table is missing... you cannot. View, PowerAutomate, not to key in. Connector to load from but not to 'type in'.). But in terms of consistency this would mean that for 1) the table 'Client' would not yet exist to prepopulate from via relationship... (you cannot assume table client already existing and table Automobile not yet existing if you are consistent.

upvoted 7 times

hismail 2 years, 1 month ago

1- Prepopulate client information: B- relationship. You need to create a one-to-many relationship between the Client and Automobile tables, and then use the lookup field on the form to display the customer's first name and last name from the Client table. 2- Enter automobile information: A- Table. You need to create a table for Automobile and add the fields for automobile make and model. Then, you need to create a form for the Automobile table and add the fields to the form layout.

upvoted 3 times

hismail 2 years, 2 months ago

1- Prepopulate client information: B- Relationship You need to create a one-to-many relationship between the Client and Automobile tables, so that each client can have multiple automobiles associated with them. Then, you can use the lookup field on the Automobile form to select the client and prepopulate their first name and last name. 2- Enter automobile information: A- Table You need to create a table for the Automobile entity, and define the fields for the automobile make and model. Then, you can use the main form of the Automobile table to enter the information.

I chose Relationship + table and got 675... lol. Doubt that was the right answer but it's not like they gave me a breakdown. This question was confusing when I was taking the exam and judging by the responses, I'm not alone.

upvoted 5 times

JalapenoJun 2 years, 8 months ago

The question is again poorly worded and very tricky.. but the answer makes sense. 1. It says that it is a custom Client table but the customer information will be coming from the client table (small letter word) - so it just makes sense to use a virtual table. 2. Automaker and automobile information can be fetch from another external source - since that's a standard information; it is more practical to get a source to fetch that information that save that on a table yourself.

upvoted 4 times

charles879987 2 years, 9 months ago

not on May 2023 exam

upvoted 2 times

CalebXin 2 years, 10 months ago

Actually the context should be that these two custom tables are not in Dataverse, that is why Virtual table is required to display the information and Connector is required to write the information.poorly worded question but your explanation kind of makes senseIf that is the case, I would say that is a lot of (missing) context. Why do they leave such room for guessing/assumptions/imagination? I figured that it must be: 1. Alternative Key - in case First and Last name were the only existing columns of the client table, then an Alternative Key would be needed to avoid duplication. 2. Table - since a table is the only option in the list that can be written/typed to.

A company uses Power Apps. You enable auditing in Microsoft Dataverse.

Users report the following issues when viewing the audit logs:

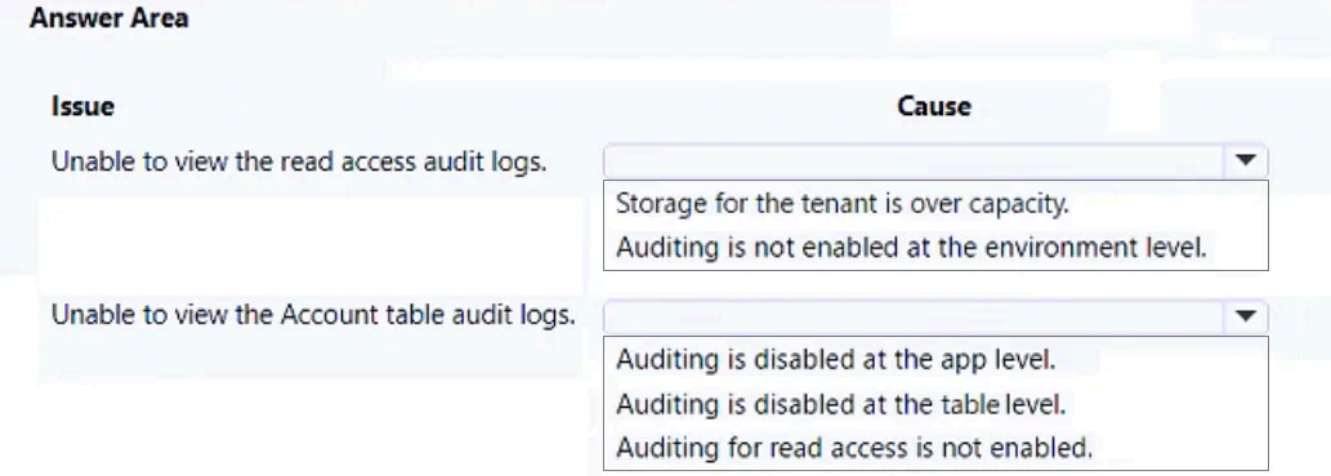
• Unable to view the read access audit logs.

• Unable to view the Account table audit logs.

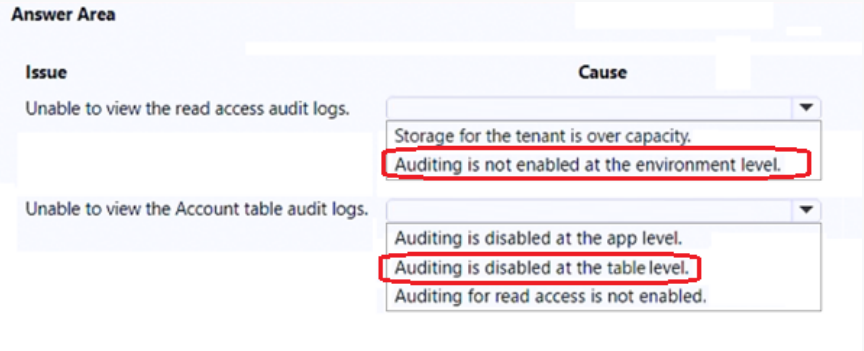
You need to troubleshoot the issues.

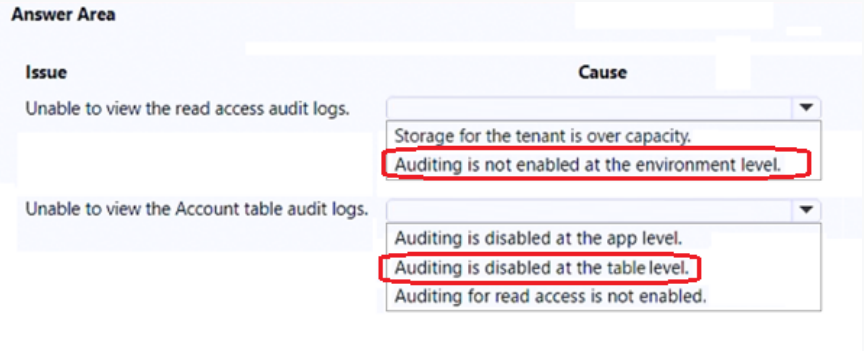
What are the causes of the issues? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.



Suggested Answer:





Aarch Highly Voted 3 years, 6 months ago

Ans are correct

upvoted 16 times

m1911 Highly Voted 2 years, 10 months ago

Crappy question with a dumb answer. It literally says "You enable auditing in Microsoft Dataverse." And then one of the answers is "Auditing is not enabled at the environment level". There are three levels where auditing can be configured: environment, table, and column. If I enabled auditing in Microsoft Dataverse then that would be at the environment level. This, unfortunately, is a "process of elimination" answer where you have to ignore part of the information in the question.

A company is implementing a data model by using Dataverse.

The company requires the following columns in a new custom table:

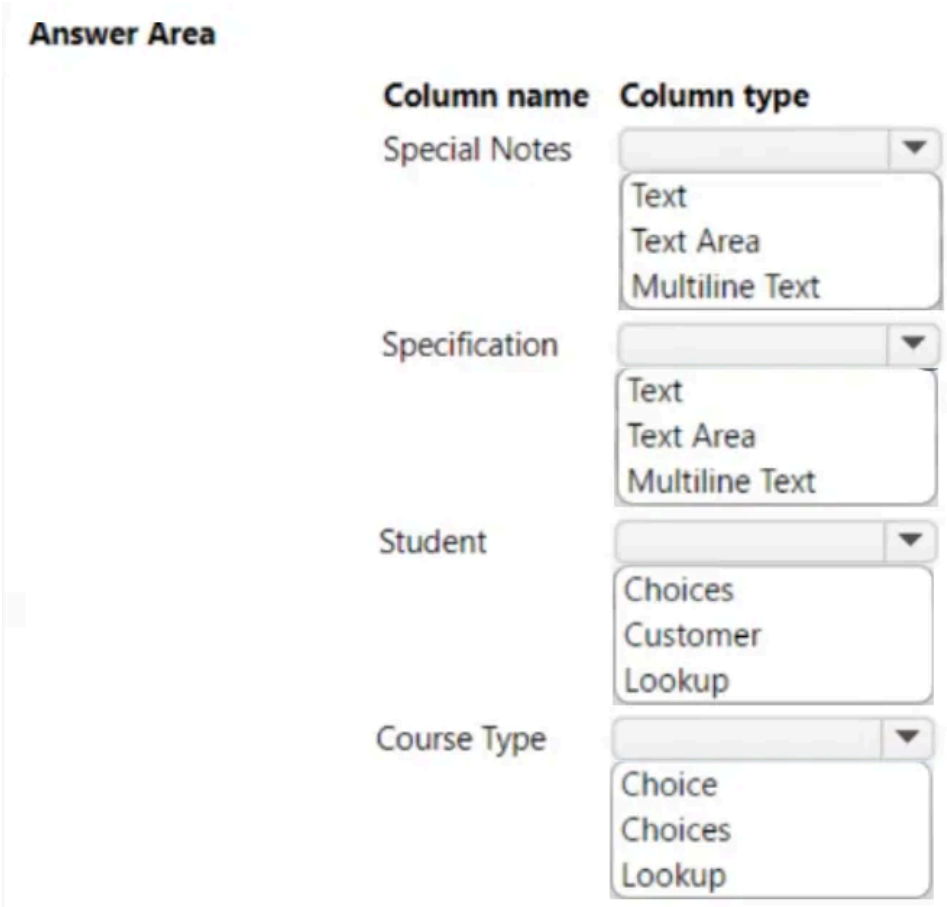
You need to choose the column type that uses the least amount of database storage for each column.

Which column types should you choose? To answer, select the appropriate options in the answer area.

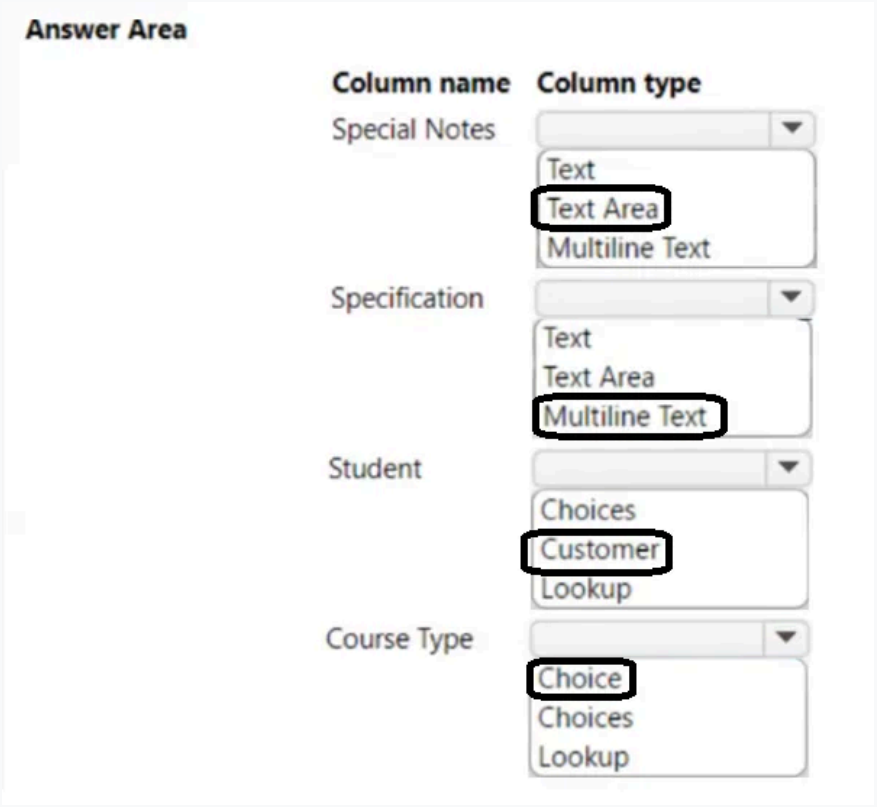
NOTE: Each correct selection is worth one point.

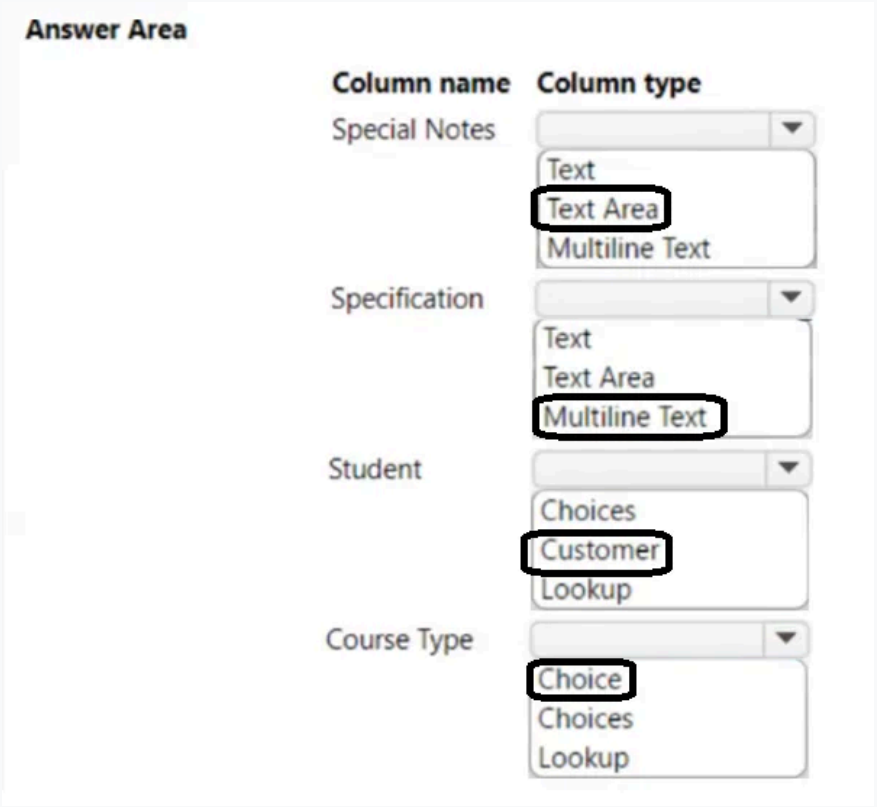
Column name	Requirement
Special Notes	Must contain string data that stores 100 characters and be rendered as a multiline control.
Specification	Must contain string data that stores up to 8,000 characters and be rendered as a multiline control.
Student	Must contain an input control that can store a reference to an account or a contact in the system.
Course Type	Must contain a list of predefined options. Users must be able to select only one option.

Answer Area



Suggested Answer:





Keeno74 Highly Voted 3 years, 2 months ago

Given answers seem correct to me on research https://www.codingninjas.com/codestudio/library/working-with-columns-in-microsoft-dataverseTo meet the company's requirements for the new custom table in Dataverse, you should configure the following column types: String data, up to 100 characters, rendered as a multiline control: Single Line of Text with a maximum length of 100 characters. String data, up to 8,000 characters, rendered as a multiline control: Multiple Lines of Text (also known as Memo) which can store up to 8,000 characters. Reference to an account or contact using a drop-down list: Lookup column, specifically a Customer type, which can reference an account or contact. List of predefined options, allowing users to select only one option: Choice (also known as Option Set) column.

To meet the company's requirements for the new custom table in Dataverse, you should configure the following column types: String data, up to 100 characters, rendered as a multiline control: Single Line of Text with a maximum length of 100 characters. String data, up to 8,000 characters, rendered as a multiline control: Multiple Lines of Text (also known as Memo) which can store up to 8,000 characters. Reference to an account or contact using a drop-down list: Lookup column, specifically a Customer type, which can reference an account or contact. List of predefined options, allowing users to select only one option: Choice (also known as Option Set) column.

It should be a lookup column for student, i've never seen a column type called 'customer'When you're creating a new lookup column, under type, you can choose lookup or customer. Customer references accounts and contacts only.it is confusing because when you create a new field, Data Type: Lookup, then select between lookup or customer. once you have selected customer. This data type changes to Customer. But first, it looks like Customer is a sub type of Lookup. but afterwards it seems like a separate data type (same in the fields overview ...).

Answer for Student column from copilot When comparing the Customer and Lookup column types in terms of database storage, the Lookup type generally uses less storage. Here's why: Customer (CustomerType): This type is specifically designed for referencing accounts or contacts. It may have some additional overhead due to its association with these specific entities. The storage requirements might be slightly higher. Lookup (LookupType): The Lookup type is more versatile; it allows you to reference various entities, not just accounts or contacts. While it provides more flexibility, it tends to have slightly less overhead compared to the Customer type. It's a better choice if you anticipate needing to link the column to other entities in the future. Therefore, if minimizing database storage is your primary concern, I recommend using the Lookup type for the "Student" column.

1- Special notes: C- Multiline text This column type allows you to store up to 100 characters and render them as a multiline control. It uses less storage than text or text area, which have a higher limit of characters. 2- Specification: C- Multiline text This column type allows you to store up to 8,000 characters and render them as a multiline control. It uses less storage than text or text area, which have a higher limit of characters. 3- Student: A- Choices This column type allows you to store a reference to an account or contact in the system using a drop-down list. It uses less storage than customer or lookup, which are more complex column types that require additional tables. 4- Course type: A- Choice This column type allows you to store a list of predefined options and let users select only one option. It uses less storage than choices or lookup, which are more complex column types that allow multiple selections or references.

HOTSPOT

-

Accompany plans to implement a model-driven app. The company will enter data through the app.

The company has the following requirements:

• Users must be able to search for the data inside the app.

• Users must be able to search for the data outside the app.

You need to configure a solution for each requirement.

What should you use? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer provided is correct. The question doesn't specify it, but the context implies all of the data we are talking about is in Dataverse. The two requirements aim to differentiate if the data is contained inside the app or not. If we want the app to only index the tables and data referenced inside the app, we cannot use Dataverse Search, as Dataverse Search configuration is global in the environment and will not be specific to each app. So the first requirement is Quick Find Search, and the second is Dataverse Search. Classic bad MS question.

upvoted 3 times

DoubleO7 1 year, 6 months ago

I think answers are correct. At first I thought that it is quick find for in app search but then I read this: When Dataverse search is turned on, it becomes your default and only global search experience for all of your model-driven apps. You won't be able to switch to quick find search also known as categorized search. so if you can't have both Dataverse and quick find at the same time, it must be Dataverse and Microsoft search.

upvoted 1 times

Skiis 1 year, 12 months ago

I actually think the answer key is correct Dataverse Search Microsoft Search My reason for Dataverse is simply because in model driven apps you can search with advance find, quick find, or dataverse. Quick find = categorized search so you cant pick both so if it has to be one its dataverse since its still possible. Might not be the best reason but thats what I think. For Microsoft search the questions asks to search data outside the app. A dataverse search only searches on data within dataverse. We need to search data outside the app, so if we want to search for stuff across all microsoft 365, we need a microsoft search. Also I sent this question to my instructor and he said he thinks its that answer as well.

seems correct

upvoted 1 times

hismail 2 years, 8 months ago

1- Search data inside the app: B- Dataverse search Dataverse search is the default and only global search experience in all model-driven apps in the environment. It delivers fast and accurate search results in a single list, sorted by relevance. It also supports suggested results as you type, better matching, smart search, operators for advanced search, and intelligence. 2- Search data outside the app: C- Microsoft search Microsoft search is a unified search platform that can extend Dataverse search to additional Microsoft Search canvases, including SharePoint Online, Bing, and Office. Users can search and find information from these canvases similar to searching in the app when the connector is enabled. It's not Quick Find because Quick Find search is a feature that allows you to search for records within a single table or entity in a model-driven app. It is also called grid search. However, the requirement is to search for data across multiple tables or entities inside the app.

Question #62 *Topic 1*

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
A company uses a Dataverse environment. The environment is accessed from canvas and model-driven apps.
The Dataverse environment contains a table that has the following columns:
• Name
• Company
• Contacted On
The company requires that the table not contain any duplicate rows when users create data in the environment.
You need to implement a solution that meets the requirement.
Solution: Create an alternate key for the columns.
Does the solution meet the goal?

A. Yes

B. No

Suggested Answer: *A*
Official Answer: A

Community vote distribution
A (100%)

iRoMeL Most Recent 1 year, 3 months ago
The correct answer is: □ A. Yes —— □ Explanation: Alternate keys in Dataverse are used to enforce uniqueness constraints on one or more columns in a table. When you create an alternate key using columns like Name, Company, and Contacted On, Dataverse will prevent duplicate rows based on the combination of those column values. • This solution works at the platform level and is respected by both canvas apps and model-driven apps. • Alternate keys are also used for integration and can improve performance when querying records.
upvoted 3 times

JohnChung 1 year, 10 months ago
An alternate key can ensure there is no duplicated record in a single table
upvoted 1 times

MrEz 2 years ago
you can make alternate keys with multiple fields name and company and contacted on. but there are 3 problems: we don't know if contacted on is date and time or date only. same name same date same company, e.g. 2 phone calls --> needs to be saved because one was in the morning and one was in the afternoon. :-) Name = standard field? like subject? if by chance the have the same topic and the user enters the same name. e.g. 2 different people call from the same company at the same time and the customer helpdesk agents enter 'super bowl ticket expiration' for name ... you are doomed. okay maybe name is fullname George W. Bush, working both (senior and junior) for Carlyle group and both have a scheduled call at 08:15 for the same company... but technically you can. yes we can.
upvoted 3 times

DaanEp 2 years ago
you want to ensure that there are no duplicate rows based on the "Name," "Company," and "Contacted On" columns. Creating an alternate key for these columns will enforce this uniqueness constraint, and users won't be able to insert rows with the same combination of values in these columns. So, the solution of creating an alternate key aligns with the goal of preventing duplicate rows, and it is a valid approach in Dataverse.

A duplicate detection rule can check multiple columns within a table to see if duplicates exist. But it won't stop user from creating the record. Only Alternate Keys can do that.
upvoted 9 times

Smith_S Most Recent 2 years, 2 months ago
The Duplicate detection rule won't work to restrict duplicate records it always creates a record whereas an alternate will give a business error if a duplicate exist
upvoted 3 times

61be873 2 years, 4 months ago
No Doesn't work in canvas apps only in model driven https://powerusers.microsoft.com/t5/Microsoft-Dataverse/Powerapps-canvas-app-does-not-respect-duplicate-detection-rules/td-p/2053503
upvoted 3 times

jmccolly 2 years, 4 months ago
I think it's A (Yes). A duplicate detection rule can check multiple columns within a table to see if duplicates exist. Base Record Type: Table A Matching Record Type: Table A Then, define the fields you want to check for duplicates with an AND operator.
upvoted 3 times

JohnChung 2 years, 4 months ago
Selected Answer: B
The answer for this question should be No.

Though duplicate detection rule triggers before you save data to existing records, it needs 2 tables to make a duplicate detection rule, "Base record and Matching record". Base record is the table for checking whether the subject of the new record exist or not. Matching record is the table the new record is going to be added to. This question mentions only one table, so the answer must be "No".

Base Record Type: Table A Matching Record Type: Table A

upvoted 2 times

MrEz 2 years, 6 months ago

A) Duplicate Detection Rule triggers before you save it. and suggests the existing records. You then can decide if it is a duplicate and you don't continue to save it. or maybe you decide it is NOT a duplicate because Name George Bush, both of them - senior and junior, happen to work for the same company, eg. Carlyle group, have e.g. a call on the same Date (we don't know if it is date only or date and time field, sheduled times could happen at same time, timestamp not but then it is almost never same) and maybe same time?! from this perspective it is even better as the alternate key

upvoted 1 times

DaanEp 2 years, 6 months ago

Duplicate detection rules in Dataverse do not directly support creating rules based on multiple columns that form the key to a table. Duplicate detection rules typically allow you to define criteria for identifying duplicate records based on individual columns. So it can work in combination with an alternate key but not on it's own.

Business rules does not prevent the creation of a duplicate row. Only alternate key does that
upvoted 3 times

killionb12 1 year, 8 months ago
Creating a business rule for the columns will not ensure that the table does not contain duplicate rows. Business rules in Dataverse are used to apply logic and validations at the form level, but they do not enforce uniqueness constraints on the data at the table level. To prevent duplicate rows, you should use alternate keys or duplicate detection rules. Alternate keys enforce uniqueness directly in the database, while duplicate detection rules help identify potential duplicates.
upvoted 4 times

Question #66 *Topic 1*

You must create a new table to support a new feature for an app. Records for the table must be associated with a business unit and specify security roles for the business unit.
You need to configure table ownership.
Which table ownership type should you use?

A. user or team owned

B. business-owned

C. none

D. organization-owned

Suggested Answer: *A*
Official Answer: A

Community vote distribution
A (100%)

5f14337 Highly Voted 2 years, 1 month ago
The “User or Team owned” table ownership type in Dataverse is designed for scenarios where records are owned by teams or users and where access rights can be restricted based on business units and security roles. This would be the appropriate choice given that the records for the new table must be associated with a business unit and specify security roles for the business unit. So, the answer is A. User or team owned.
upvoted 7 times

killionb12 Most Recent 1 year, 8 months ago
Given the requirement that records must be associated with a business unit and specify security roles for the business unit, the correct table ownership type to use is: A. user or team owned This ownership type allows you to associate records with specific users or teams, which can be aligned with business units. It also enables you to specify security roles for those users or teams, ensuring that access and permissions are managed appropriately.
upvoted 2 times

Question #67 *Topic 1*

DRAG DROP

-

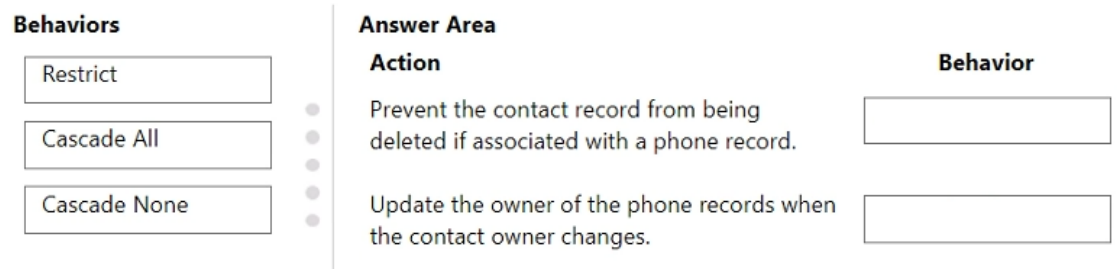
A company uses Power Apps.

You create a custom phone table that is a child of the contact table.

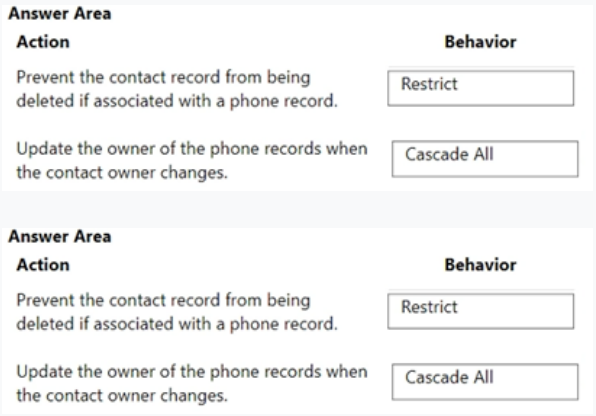
You need to configure the cascading rules for each action.

Which behavior should you use? To answer, drag the appropriate behaviors to the correct actions. Each behavior may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.



Suggested Answer:



Buka Highly Voted 1 year, 11 months ago

Correct, the link https://learn.microsoft.com/en-us/power-apps/developer/data-platform/configure-entity-relationship-cascading-behaviorIt's a Parental Relationship: Cascade All, Cascade All. the cascade effect works from the parent to the child, not the other way around. This ensures that deleting a child record does not inadvertently remove important parent records.

upvoted 7 times

BeachVball 1 year, 8 months ago

It's a Parental Relationship: Cascade All, Cascade All. the cascade effect works from the parent to the child, not the other way around. This ensures that deleting a child record does not inadvertently remove important parent records.

upvoted 1 times

examtopicss1122 Most Recent 1 year, 5 months ago

Restrict - Cascade All. Explanation: 1) You're setting up a relationship behavior for the newly created table(phone). You can choose a "Referential" relationship behavior and select "Restrict" for the Delete action. In this case, the parental record cannot be deleted since there's at least one child record. 2) Cascade All is the only available option that can update all the children records if the parent was updated

Question #68 *Topic 1*

Your organization does not permit the use of custom code for solutions.
You need to create a view that can be viewed by all users in an organization.
Where should you create the view?

A. System Settings

B. Advanced Find

C. Table component of a solution

D. Microsoft Excel template

Suggested Answer: *C*
Official Answer: C

Community vote distribution
C (100%)

5f14337 Highly Voted 2 years, 1 month ago
C. Table component of a solution In Dataverse, you can create a view that can be viewed by all users in an organization in the table component of a solution. This does not require any custom code and adheres to the organization's policy. So, the answer is C. Table component of a solution.

twice in a row is wild
upvoted 5 times

killionb12 1 year, 8 months ago
Creating the view within the Table component of a solution ensures that the view can be accessed by all users in the organization. This method does not require custom code and allows the view to be included as part of the managed solution, making it easier to deploy and maintain across the organization.

Virtual tables in Dataverse enable integration with external data sources, allowing data to appear and behave like native Dataverse tables without storing it in the Dataverse database. To achieve this, a data provider must be configured to define the connection between Dataverse and the external data source.
upvoted 2 times

Question #70 *Topic 1*

A company is evaluating the capabilities in Dataverse and the scenarios for using virtual tables.
You need to identify the capabilities of virtual tables.
What is a capability of virtual tables?

A. Virtual tables can be configured for user and team ownership.

B. Virtual tables support Dataverse auditing.

C. Virtual tables contain columns for Status, Created On, and Modified On by default.

D. Virtual tables require configuration of a data provider.

Suggested Answer: *D*
Official Answer: D

Community vote distribution
D (93%)

5f14337 Highly Voted 2 years, 1 month ago
D. Virtual tables require configuration of a data provider Virtual tables in Dataverse are used to surface data from external systems. For a virtual table to function, it requires the configuration of a data provider and data source. The data provider is a component that is installed into the Dataverse environment that can bridge the Dataverse platform with an external system. So, the answer is D. Virtual tables require configuration of a data provider.
upvoted 11 times

ef1336e Most Recent 4 months, 1 week ago
Claude, ChatGPT, and Perplexity agree: D. Virtual tables require configuration of a data provider
upvoted 1 times

Ridderxxl 6 months, 1 week ago
As braddles says, "D isn't a capability its a setup requirement." which is correct. However, as per the documentation "The following are limitations of virtual tables that should be considered. Only organization-owned tables are supported. The security filtering applied to user-owned tables isn't supported." https://learn.microsoft.com/en-us/power-apps/developer/data-platform/configure-entity-relationship-cascading-behavior
upvoted 1 times

braddles 1 year, 4 months ago
D isn't a capability its a setup requirement. A is now possible with virtual entities as of 2023
upvoted 1 times

killionb12 1 year, 8 months ago
Virtual tables in Dataverse integrate data from external sources without replicating it. To achieve this, they require a data provider that manages the connection and data operations between Dataverse and the external data source
upvoted 1 times

Question #71 *Topic 1*

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
A company uses Dataverse.
The company plans to store and manage documents and data in the environment. The company requires a solution that minimizes Dataverse storage consumption.
You need to recommend a solution.
Solution: Enable attachments for a table.
Does the solution meet the goal?

A. Yes

B. No

Suggested Answer: *B*
Official Answer: B

Community vote distribution
B (100%)

examtopicss1122 Most Recent 1 year, 5 months ago
Correct. Enabling attachments for tables means that the system requires more space in order to archive documents. The best solution here should be SharePoint integration since will only be store a reference to the document in Dataverse
upvoted 3 times

killionb12 1 year, 8 months ago
Enabling attachments for a table will actually increase Dataverse storage consumption because attachments are stored within the Dataverse environment. To minimize storage consumption, you should consider using SharePoint integration for document management. This allows you to store documents in SharePoint while linking them to records in Dataverse, effectively reducing the storage used in Dataverse.

Case Study

-

This is a case study. Case studies are not timed separately. You can use as much exam time as you would like to complete each case. However, there may be additional case studies and sections on this exam. You must manage your time to ensure that you are able to complete all questions included on this exam in the time provided.

To answer the questions included in a case study, you will need to reference information that is provided in the case study. Case studies might contain exhibits and other resources that provide more information about the scenario that is described in the case study. Each question is independent of the other questions in this case study.

At the end of this case study, a review screen will appear. This screen allows you to review your answers and to make changes before you move to the next section of the exam. After you begin a new section, you cannot return to this section.

To start the case study

-

To display the first question in this case study, click the Next button. Use the buttons in the left pane to explore the content of the case study before you answer the questions. Clicking these buttons displays information such as business requirements, existing environment, and problem statements. If the case study has an All Information tab, note that the information displayed is identical to the information displayed on the subsequent tabs. When you are ready to answer a question, click the Question button to return to the question.

Background

-

Contoso Suites is an animal shelter that specializes in finding homes for dogs that have been given up by their owners. The shelter can house up to 20 dogs.

The shelter is implementing one model-driven Power Apps app to track the dogs and schedule meetings with potential adopters. No other apps will be created.

The model-driven app uses Dataverse with out-of-the-box functionality when possible. Dataverse is set up with the following configuration:

• The solution prefix “cs” is used for all new components.

• Only the root business unit is used.

• All tables are stored in Dataverse and do not require rapid scaling.

• Exchange server-side sync is not configured.

Adopters

-

• Adopter information is stored in a Contact table.

• Contacts are considered to be duplicates if they have the same email address and last name.

• Adopters are often late to meetings, so a reminder email is sent to them two hours before their meeting.

• The email reminders must not be tracked in the system.

Dogs

-

• Dog information is stored in a Dog table, which is organization owned.

• Breed, size, and weight are fields in the table.

Dog residency

-

• A Resident table tracks the stay of each dog.

• Each resident record has a lookup for the dog and its food.

• The food type and amount are logged on each resident record. Auto-posting is not configured for changes to food type and amount.

• A fee of $120 is in a currency column named Adoption Fee. This fee can be changed depending on the adoption circumstances.

• A formula column named Deposit is automatically populated with 20% of the adoption fee.

• A resident record is generated automatically when a dog record is created. This is the only way a resident record can be created.

Exercise and feedings

-

• Exercise for the dogs is tracked in an Exercise table.

• Feedings are tracked in a Feeding table.

• Exercise and feeding records appear in a resident record timeline.

Care staff

-

• The care staff must be able to view who changed the food type and the amount that was given, for up to three months ago.

• The staff must be able to update the weight of a dog on the resident record.

• The staff report that the buttons are too small on the touch screen they use to log exercise and feeding.

• The staff must be able to view who the adopters are for upcoming meetings. The staff must not be able to update adopter information.

Administrative staff

-

• Administrative staff must receive a weekly list of duplicate contacts. Duplicate alerts must not appear when a staff member saves a new contact.

• When an adopter wants to adopt a dog, the staff must perform a series of adoption duties in order. The following duty list must be displayed on the screen:

o Commitment:

- Obtain adopter signature in a commitment document.
- Collect deposit.

o Pre-pickup:

- Document spay or neutering date.
- Perform spay or neutering.
- Document pickup date.

o Pickup:

- Collect full payment.
- Verify dog is picked up.

o A dog must be picked up no sooner than two days after spaying or neutering.

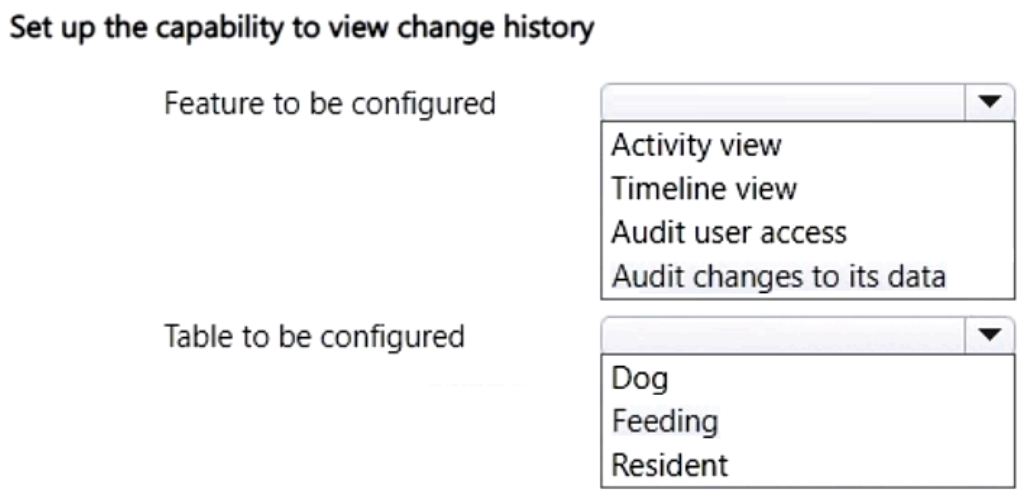
o A pop-up window must appear with an error message if the Pickup date is too soon.

o Only administrative staff must be able to add new adopters and dogs.

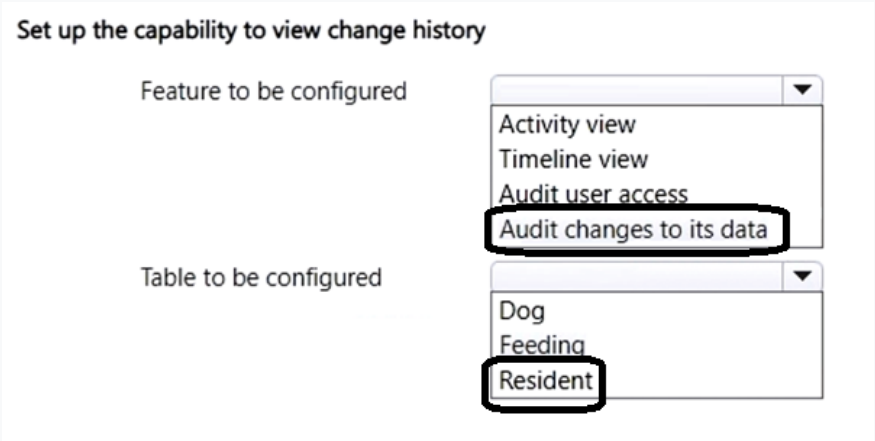
You need to set up the capability to view the change history for the food type and amount.

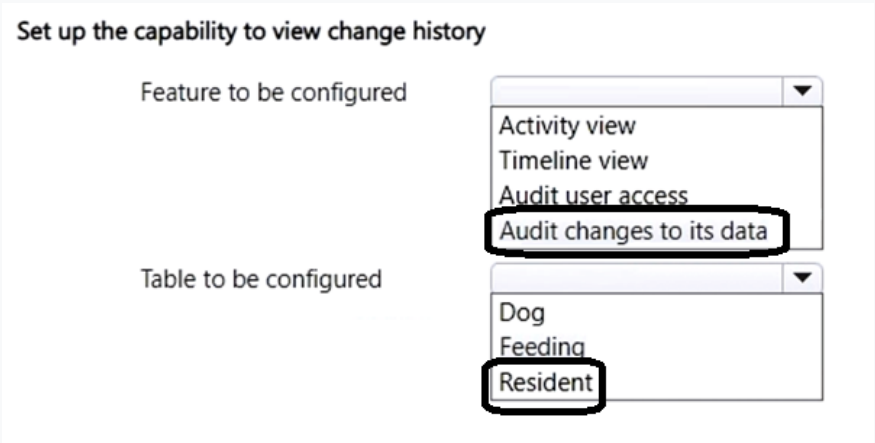
What should you set up? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.



Suggested Answer:





HTS Most Recent 1 year, 5 months ago

I agree: 'The food type and amount are logged on each resident record. ' -> audit changes on the Resident table.

As per https://learn.microsoft.com/en-us/power-apps/maker/data-platform/formula-columns?tabs=type-or-paste#functions: Direct use of currency columns and exchange rate in the formula is currently unsupported. The use of currency and exchange rate columns is achieved through the Decimal function, such as Decimal(currency column) or Decimal(exchange rate). I have actually tested it and can confirm that 'A' is the ONLY CORRECT answer.

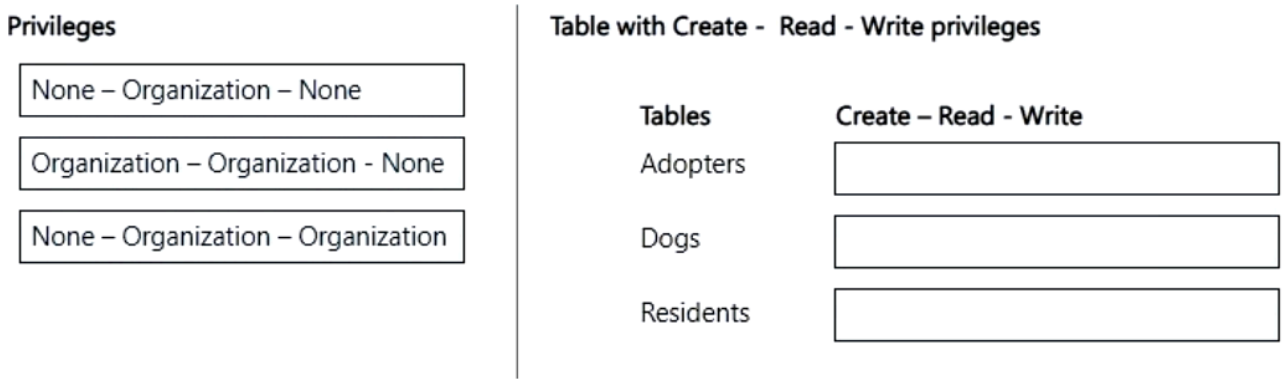
You need to set up a security role for the care staff.

Which privileges should you set? To answer, move the appropriate privileges to the correct create, read, write tables. You may use each create, read, write privileges once, more than once, or not at all. You may need to move the split bar between panes or scroll to view content.



Suggested Answer:

Table with Create - Read - Write privileges

Tables	Create – Read - Write
Adopters	None – Organization – None
Dogs	None – Organization – None
Residents	None – Organization – Organization

Table with Create - Read - Write privileges

Tables	Create – Read - Write
Adopters	None – Organization – None
Dogs	None – Organization – None
Residents	None – Organization – Organization

cd32c1b Highly Voted 1 year, 2 months ago

Adopters None-Organization-None Dogs None-Organization-Organization Residents None-Organization-Organization Justification: Adopters: Care staff should only view adopter information to prepare for meetings. They should not create or edit contact records. Dogs: Care staff must be able to update weight data, which resides in this table, so they need read and write access. Residents: They view and update details such as food type, amount, and weight—so read and write access is needed, but not create (since records are auto-generated).

You are configuring Dataverse for a company.

The company has the following requirements for document management, which must be met by using native functionality:

• A single file must be stored and accessed directly from an Account row. No additional metadata should be captured.

• Multiple files must be stored and accessed from a Contact with support for version control.

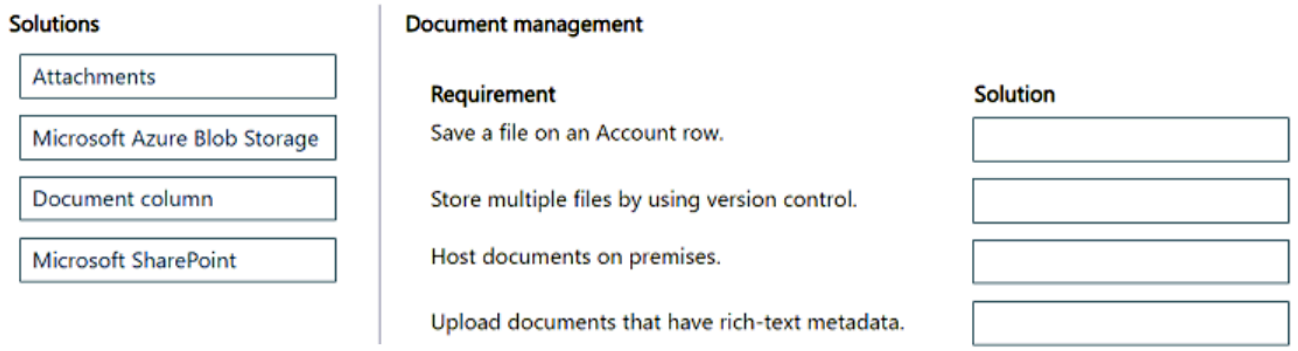
• Documents must be stored within an on-premises environment.

• Additional rich-text notes must be stored alongside one or multiple file uploads.

You need to recommend a solution for each requirement.

Which solution should you recommend? To answer, move the appropriate solutions to the correct requirements. You may use each solution once, more than once, or not at all. You may need to move the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.



Suggested Answer:

Question #83 *Topic 1*

A company is evaluating the capabilities in Dataverse and the scenarios for using virtual tables.
You need to identify the capabilities of virtual tables.
What is a capability of virtual tables?

A. Virtual tables store data in the Dataverse environment.

B. Virtual tables contain time dimension attributes by default.

C. Virtual tables support change tracking.

D. Virtual tables retrieve data from an external data source.

Suggested Answer: *D*
Official Answer: D

Question #1 *Topic 2*

DRAG DROP -

You create an app to manage customer service cases.

Cases entered in forms require different types of data to be stored in different types of columns.

You need to create forms for each of the following case types:

Which form types should you create? To answer, drag the appropriate form types to the meet the data entry requirements. Each source may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Select and Place:

Case type	Requirement
Case type A	A new case form that includes a timeline
Case type B	A new case form that includes a business process flow
Case type C	A new case form that can display case data on an interactive dashboard
Case type D	A new mobile-friendly case form that requires minimal fields for record creation
Case type E	A new mobile-friendly case form that displays the subject, case title, and status fields from a parent case

Main Main Card Quick create Quick viewJust giving back to the community. This appeared on 3/18/2022 exam. Correct answerThanksCurrent Answer is correct. Main, Main, Main, Quick Create, Quick view. The reason card form isn't correct for Case Type C is due to the following. Card forms in Dataverse are designed to present information in a compact format, making them suitable for mobile devices and views within model-driven apps. However, they are not ideal for displaying detailed case data on an interactive dashboard for the following reasons: Limited Detail: Card forms are intended to show a summary of information and are not designed for detailed data entry or display. Read-Only Grid Dependency: Adding card forms to views requires the deprecated Read-only Grid control, which is no longer the default grid control for tables in Dataverse. Interactivity: Main forms provide more interactive elements and customization options, making them better suited for embedding in dashboards where users need to interact with detailed case data. For displaying detailed case data on an interactive dashboard, a Main form is more appropriate as it supports comprehensive data entry and interactive components.

Main Main Card Quick Create Quick Viw. Quick Create Form: Use it when you want to make a new entry quickly with just the basic details. Think of it like a simple, one-page form for creating things fast, like adding a new contact. Main Form: This is your go-to form for seeing and changing detailed information about something. It's like the full-page view where you can edit all the details of a record, such as an account or opportunity. Quick View Form: Imagine it as a little window on the main form that shows related info from another thing. It's like a sneak peek at important details, like seeing a contact's info when you're looking at an associated account. Card Form: Picture it as a small, compact card that shows essential info at a glance. Use it when you want a simple, condensed view, like seeing a list of leads with just their names and statuses.

Question #2 *Topic 2*

DRAG DROP -

You are a Dynamics 365 Customer Service developer.

A salesperson creates a chart.

You need to ensure that the chart is available to all users on the team.

Which actions should the salesperson perform? To answer, drag the appropriate actions to the correct users. Each action may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Select and Place:

Actions	Answer Area	
Share the chart with the team.	Step	Action
Assign the chart to each person on the team.	1	Action
Export the user chart to Microsoft Power BI. Import it as a Power BI visualization.	2	Action
Export the user chart for import as a user chart.		
Export the user chart for import as a system chart.		

Suggested Answer:

Actions	Answer Area	
Share the chart with the team.	Step	Action
Assign the chart to each person on the team.	1	Export the user chart for import as a user chart.
Export the user chart to Microsoft Power BI. Import it as a Power BI visualization.	2	Share the chart with the team.
Export the user chart for import as a user chart.		
Export the user chart for import as a system chart.		

Actions	Answer Area

wfrf92 4 years, 8 months ago

I found the below explanation from one of the forum. 1 - Share the chart with the team - CORRECT as by sharing the chart with a team, all the team members will have access to the chart 2 - Assign the chart to each person on the team - INCORRECT as you can only share with one user or with a all team. In the answer they explicitly refer to each person on the team 3 - Export the user chart to Microsoft Power BI. Import it as a Power BI visualization - INCORRECT - you can only export as a XML (no option to export for Power BI) 4 - Export the user chart for import as a user chart - CORRECT - as a sales person, I can export the chart as XML. Later on, another user can import the XML and the chart will be showed as a Personal Chart 5 - Export the user chart for import as system chart - INCORRECT - only a System Admin can import System Chart

upvoted 36 times

Ikhalil 2 years, 11 months ago

I think the is 1- Share the chart with the team. 5- Export the user chart for import as a system chart.

upvoted 4 times

Ikhalil 2 years, 11 months ago

I think the is 1- Share the chart with the team. 5- Export the user chart for import as a system chart.The answer is in another order 4 - Export the User Chart for import an User Chart (this is because it needs to remind a Personal Chart and not System) 1 - Share the Chart with the Team

upvoted 4 times

D365Apprentice 2 years, 9 months ago

The answer is in another order 4 - Export the User Chart for import an User Chart (this is because it needs to remind a Personal Chart and not System) 1 - Share the Chart with the Team

Correct

upvoted 2 times

ChristinaB 4 years, 3 months ago

"Sharing" is not in the concept of sharing that we're probably all thinking - where you "share" records in the system with other users/teams. I think in this question "sharing" is sending it to another user to import into the system under their login so the order DOES matter. Export it was a user chart and then share it with the other users [by sending them the file in an email or uploading it to a shared drive]. I was just trying to look at it from another perspective to help me remember how to answer it on the test.

Question #3 *Topic 2*

HOTSPOT -

You implement an editable grid for the Account entity.

The business team provides the following list of features that they would like you to implement:

- ✑ Group by or sort columns in the current view.
- ✑ Configure a business rule to show an error message.
- ✑ Edit values in calculated fields.
- ✑ Edit the Address composite field.
- ✑ Use the editable grid on mobile phones.

Which actions can you perform? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Action	Can be performed?
Group by or sort columns in the current view.	Yes / No
Configure a business rule to show an error message.	Yes / No
Edit values in calculated fields.	Yes / No
Edit the Address composite field.	Yes / No
Use the editable grid on mobile phones.	Yes / No

Suggested Answer:

Answer Area

Action	Can be performed?
Group by or sort columns in the current view.	Yes
Configure a business rule to show an error message.	Yes
Edit values in calculated fields.	Yes
Edit the Address composite field.	No
Use the editable grid on mobile phones.	No

Answer Area

Action	Can be performed?
Group by or sort columns in the current view.	Yes
Configure a business rule to show an error message.	Yes
Edit values in calculated fields.	Yes
Edit the Address composite field.	No
Use the editable grid on mobile phones.	No

Item 3: No

upvoted 19 times

examtopicss1122 Most Recent 1 year, 5 months ago

It should be: Yes, Yes, No, No, Yes. You cannot directly change the value of a calculated field. You can only change the formula. Yes, you can use an editable grid on a mobile phone. However, the grid will be in "Read-only' state

upvoted 2 times

HAZZTA 2 years, 1 month ago

Re: Edit values in calculated field: My logic here is that calculated columns perform a calculation based on other data in the entity or form, so making it editable would defeat that purpose, enabling a user to enter invalid data.

upvoted 1 times

HAZZTA 2 years, 1 month ago

Re: Editable grid on mobile phones: Based on customer feedback, we have removed the editable grid experience from phones. When using a editable grid on a phone, you will see a read-only version of the list control. https://learn.microsoft.com/en-us/power-apps/maker/model-driven-apps/make-grids-lists-editable-custom-control#editable-grids-dont-work-on-phones So the answer would be: Yes, Yes, No, No, No.

Question #4 *Topic 2*

DRAG DROP -

You must create a form for team members to use. The form must provide the ability to:

✑ Lock a field on a form.

✑ Trigger business logic based on a field value.

✑ Use existing business information to enhance data entry.

You need to implement business rule components to create the form.

Which components should you use? To answer, drag the appropriate components to the correct requirements. Each component may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Select and Place:

Question #5 *Topic 2*

You have a form that displays a custom field from an entity.
A customer wants to restrict users from filtering on the custom field.
You need to prevent users from filtering the field in Advanced Find.
What should you modify?

A. Fields in the Edit Filter Criteria option of the Quick Find view

B. a searchable field on the Field Properties form

C. Fields in the Add Find Columns option of the Quick Find view

Suggested Answer: *B*
Setting Searchable property to No, makes the field disappear from the available fields for the Filter configuration, but it won't hide the field when adding columns to the view. This property has no impact on behaviour of the Global and Quick Find Search. B, but bad wording. for me: searching = add field as a condition filtering: add field to column and then filter for this field (on a saved ADF view). only with FLS possible (for me it would be nicer to remove non searchable fields from columns, it is more consistent and would not clutter fields in the add column).

Question #7 *Topic 2*

You have a canvas app that allows users to view, select, and purchase products. The app uses a Gallery control to display products and checkboxes that allow users to select products.
When users select items from the product catalog, they move to a different screen to complete a purchase.
Users must be able to clear all product selections when they click the button.
You need to configure the button.
What should you do?

A. Use the Reset(Control) formula and pass the gallery control as a parameter to the Reset formula.

B. Use the Reload(Control) formula and pass the gallery control as a parameter to the Reload formula.

C. Use the ForAll() function to iterate through each item of the Gallery and clear user selections.

D. Set the OnCheck value to populate a collection and the OnUncheck value to remove the item from the collection. Clear collection when the user selects the button.

Suggested Answer: *A*
Official Answer: A

Community vote distribution
D (66%) A (34%)

Kalki602 Highly Voted 5 years, 6 months ago
Answer is D, 100%. The very same example is part of App in a day training, Canvas app module, page 28, to be very specific. It clearly says: select the Checkbox control and click on the Action tab in the ribbon, click OnCheck and set value in the formula bar to: Collect (CompareList, ThisItem). Set the OnUncheck value to Remove(CompareList, ThisItem). This is required to make sure the unchecked items are removed from the collection"

I normally do not reply to these but I can see where the confusion is. But Answer A is the correct choice. According to the documentation (Microsoft Docs on Gallery Control): Reset() works with a Gallery control by iterating through all the child controls inside the Gallery and resetting them to their default values. This means you can reset all checkboxes within the Gallery by simply passing the Gallery control to the Reset() function. You just need to ensure the 'Default property of the checkbox is set to false. D is definitely not correct as it only pertains to a collection. If anyone has been creating apps for years they will discover this. For those that said nothing happened, more than likely there was a problem with your code, not the formula function. Also, for added reference, you can view this video as well: (and this is from 3 years ago lol). https://www.youtube.com/watch?v=691pRyRHWBU

D. Set the OnCheck value to populate a collection and the OnUncheck value to remove the item from the collection. Clear the collection when the user selects the button. This approach ensures that you have a collection tracking the selected items, and you can easily clear this collection when needed, effectively resetting the selections.

upvoted 1 times

HAZZTA 2 years, 1 month ago

Answer A. The question is very specific - It asks you to add a button that rests that clears product selections when the button is clicked, not what what the entire process of adding and removing items should be. I think this is a clear case of answering the question, not providing a solution to the preamble.

In Power Apps, the Reset function is used to reset a control to its default value. In this case, you want to clear all product selections in the gallery control when the user clicks a button. By passing the gallery control as a parameter to the Reset function, you can achieve this. The Reset function will reset all controls within the gallery, including the checkboxes, effectively clearing all product selections. The other options are not appropriate for this scenario: B. The Reload function does not exist in Power Apps. C. The ForAll function could be used to iterate through each item in the gallery, but it would be more complex and less efficient than using the Reset function. D. While you could use the OnCheck and OnUncheck properties to manage a collection of selected items, this would not directly affect the selections in the gallery control itself. Clearing the collection would not uncheck the checkboxes in the gallery.

upvoted 4 times

TwelveConsulting 2 years, 10 months ago

I would go with C, as it allows to patch information directly to the Table / Collection with the proper functions put afterwards. A does not work at all when I test it. D does not clear all values, so it does not answer the question.

upvoted 1 times

anakinskwlkr 2 years, 10 months ago

Its clearly A. This question specifically states: " Users must be able to clear all product selections when they click the button. YOU NEED TO CONFIGURE TE BUTTON" D is a bunch of steps to configure all the actions, but its not what the question is asking.

Question #8 *Topic 2*

HOTSPOT -

You have a canvas app that contains the following text input fields: Id, FirstName, LastName. The app also has a button named Button1.

The OnSelect property for Button1 contains the following expression:

Collect(People, {Id:Id.Text, FirstName:FirstName.Text, LastName:LastName.Text})

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

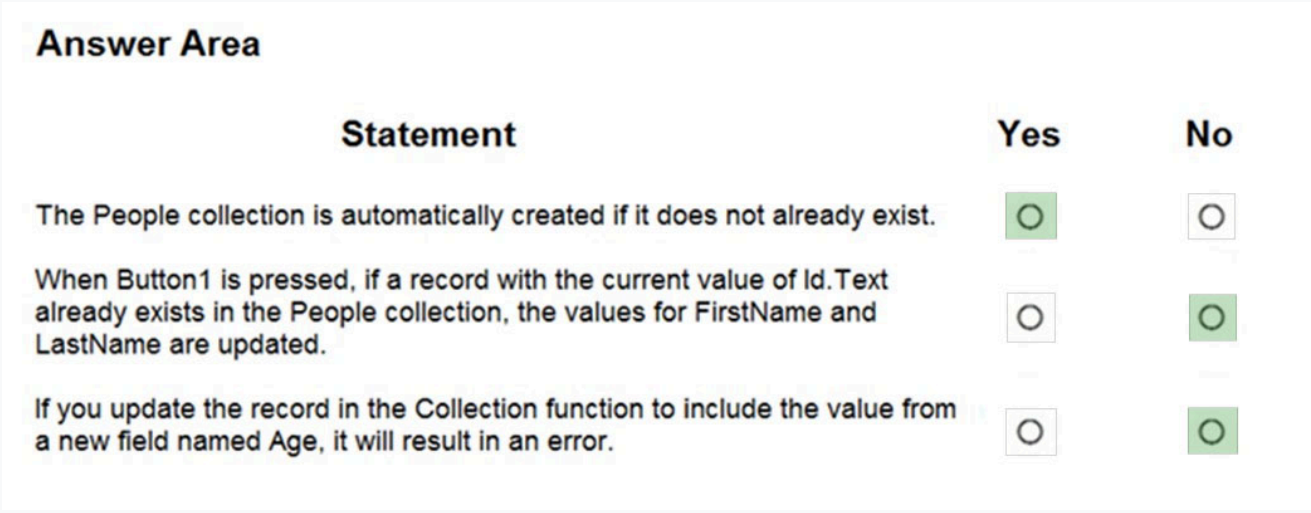
NOTE: Each correct selection is worth one point.

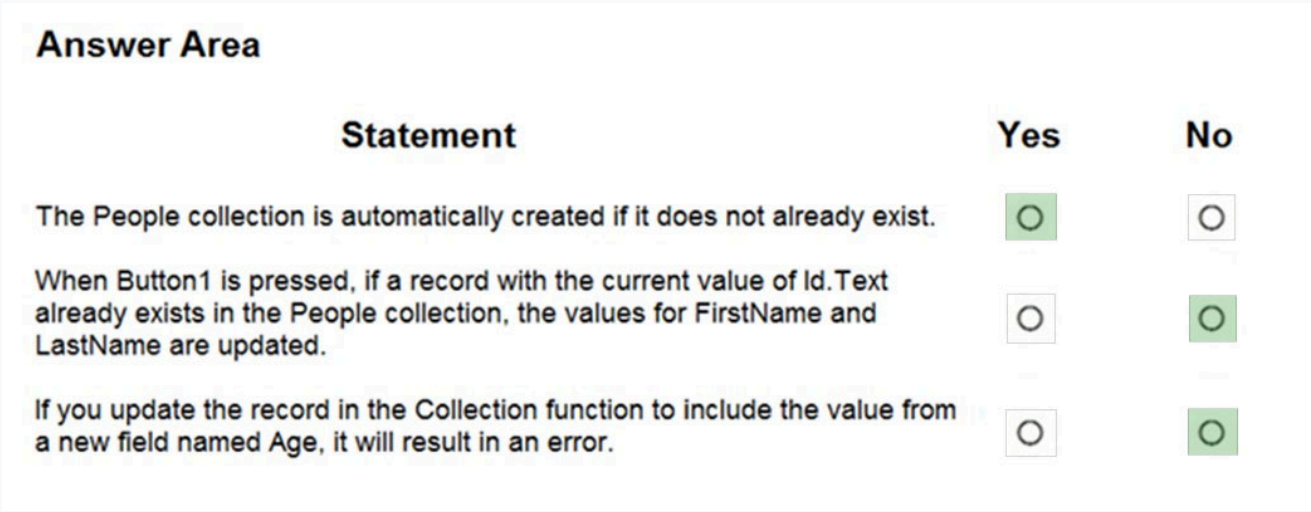
Hot Area:

Answer Area

Statement	Yes	No
The People collection is automatically created if it does not already exist.	○	○
When Button1 is pressed, if a record with the current value of Id.Text already exists in the People collection, the values for FirstName and LastName are updated.	○	○
If you update the record in the Collection function to include the value from a new field named Age, it will result in an error.	○	○

Suggested Answer:





Box 1: Yes - If the data source doesn't already exist, a collection is created.

Box 2: No - Note: The Collect function adds records to a data source. The items to be added can be: ✑ A single value: The value is placed in the Value field of a new record. All other properties are left blank. ✑ A record: Each named property is placed in the corresponding property of a new record. All other properties are left blank. ✑ A table: Each record of the table is added as a separate record of the data source as described above. The table isn't added as a nested table to a record. To do this, wrap the table in a record first.

Box 3: No - Reference: https://docs.microsoft.com/en-us/powerapps/maker/canvas-apps/functions/function-clear-collect-clearcollect

PL_600 Highly Voted 3 years, 5 months ago

Correct

upvoted 17 times

derekmalaga Highly Voted 2 years, 6 months ago

Given Answer is correct: A) YES - Collect() will create the collection if it does not exist B) NO - Collect() will create a duplicated item. To update the record you should use a different formula C) NO - Using first: Collect(colMyGallery,{id:1,Name: "John", Attendance: false) and later Collect(colMyGallery,{id:2,Name: "Lisa",Attendance:false, Age: 30}) will add a new column to the collection and won't trigger any error Id Name Attendance Age 1 John false 2 Lisa false 30

HOTSPOT -

You are a Dynamics 365 Customer Service administrator.

A user must be able to view system posts and activities in a dashboard.

You need to create the dashboard for the user.

Which components should you use? To answer, select the appropriate options in the answer area.

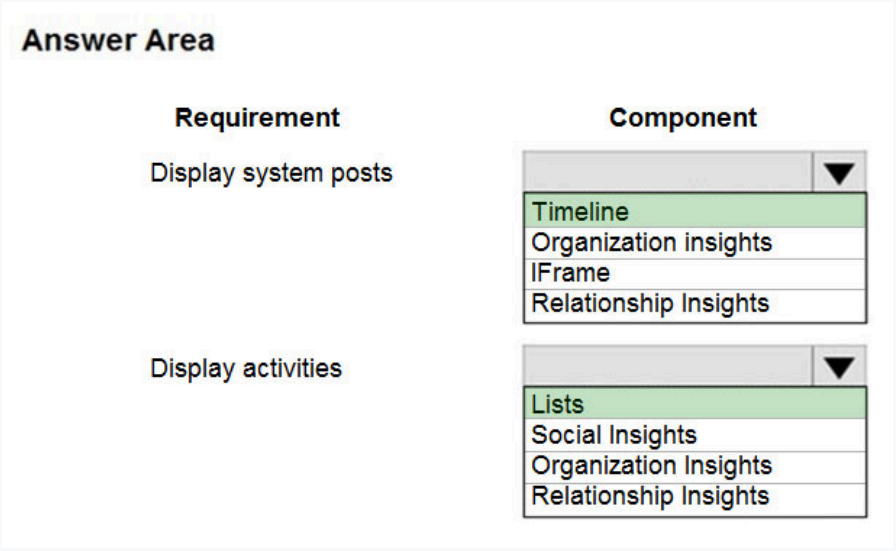
NOTE: Each correct selection is worth one point.

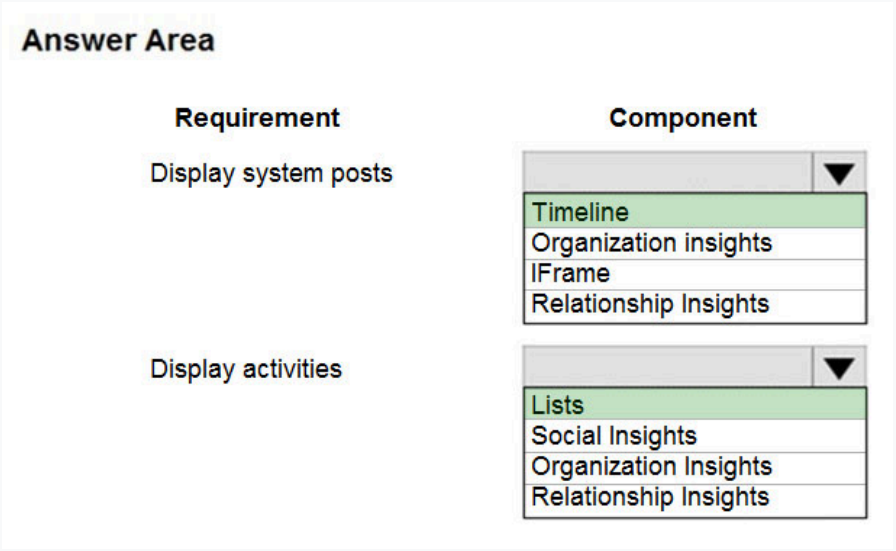
Hot Area:

Answer Area

Requirement	Component
Display system posts	Timeline Organization insights IFrame Relationship Insights
Display activities	Lists Social Insights Organization Insights Relationship Insights

Suggested Answer:





Box 1: Timeline - The timeline helps agents see all customer interaction history across channels, personnel, and the support lifecycle. The timeline is used across Dynamics 365 applications to capture activities like notes, appointments, emails, tasks, and more, to ensure that all interactions with the customer are tracked and visible over time. Agents use the timeline to quickly catch up on all of the latest activity details with the customer to provide the most personalized support experience.

Box 2: Lists - Reference: https://docs.microsoft.com/en-us/dynamics365/customer-service/customer-service-hub-user-guide-timeline-admin

jkaur 4 years, 5 months ago

correct

upvoted 3 times

burntsecondary 4 years, 8 months ago

This answer is correct, I needed to do some research on Timelines for dashboards. Even though timelines are limited on a dashboard they can display a users Activities and Posts. https://docs.microsoft.com/en-us/dynamics365/customer-service/customer-service-hub-user-guide-timeline-admin#configure-dashboard-timelines Since the second option does not include Timeline as an option, a list/view of that users Activities would be easy to do on a dashboard.

What is meant with Lists?

upvoted 2 times

Daniel12345 5 years ago

What is meant with Lists?Lists are table views in the context of an dashboard.Interesting. So 'list' is not the entity list but common parlor for what CRM professionals refer in technical language to as 'view', 'advanced find view' or entity 'userquery'(sql for CDS), 'savedquery' (fetchxml). Quite picky for so many names addressing the very same object.

upvoted 2 times

Question #10 *Topic 2*

You are building a model-driven app. The environment has Advanced settings enabled.
A form in the app requires a custom interface.
You need to embed the custom interface onto the form without using custom code.
What should you do?

A. Create a canvas app and bind its properties to the form.

B. Modify the model-driven app to use tablet form factor.

C. Use an IFRAME.

D. Create a quick view form.

Suggested Answer: *A*
Official Answer: A

Community vote distribution
A (86%) C (14%)

05e3903 Most Recent 1 year, 1 month ago
iFrame would not be a no-code/low-code option. A is correct.
upvoted 2 times

A is correct
upvoted 1 times

braddles 1 year, 4 months ago
Embedding an iframe is still considered custom code - I'll say A is correct as you can create/embed a canvas app without writing any code
upvoted 3 times

seid92 1 year, 4 months ago
Develop the custom interface (e.g., a web application, custom HTML content, or any external site) that you want to embed.
upvoted 1 times

Question #11 *Topic 2*

A company is implementing Power Apps and Power Automate.
Several components are created within Power Apps, Microsoft Dataverse, and Power Automate. These components must be promoted from the development environment to the user acceptance test environment in a single solution package.
You need to create the solution package for promotion.
Where should you create the package?

A. Azure DevOps

B. Power Apps designer

C. Microsoft Power Platform admin center

D. Azure portal

E. Office 365 admin center

Suggested Answer: *C*
To create a solution: 0. Start Microsoft Power Platform admin center 1. Sign in to Power Apps and select Solutions from the left navigation. 2. Select New solution and then complete the required columns for the solution. 3. Select Save. Then add components to the solution. Note: The Power Platform admin center provides a unified portal for administrators to manage environments and settings for Power Apps, Power Automate, and customer engagement apps (Dynamics 365 Sales, Dynamics 365 Customer Service, Dynamics 365 Field Service, Dynamics 365 Marketing, and Dynamics 365 Project Service Automation). Incorrect: Not B: Power Apps Studio is the app designer used for building canvas apps. Reference: https://docs.microsoft.com/en-us/powerapps/maker/data-platform/create-solution

Community vote distribution

busitecgmbh Highly Voted 3 years, 11 months ago
Am I wrong or is this just a bad question? Yeah, Power Apps DESIGNER may be wrong, but you also can't create a solution in the Power Platform Admin Center. Should be "Power App"- or "Power Platform"-Surface or something like that.
upvoted 18 times

busitecgmbh Highly Voted 3 years, 11 months ago
Am I wrong or is this just a bad question? Yeah, Power Apps DESIGNER may be wrong, but you also can't create a solution in the Power Platform Admin Center. Should be "Power App"- or "Power Platform"-Surface or something like that.you can go from admin center to power app.. it doesn't make sense, but it is the 'best' choice here lolIs Power Apps Designer/Studio the place you go for the construction of the application? Meaning where you add the components and Power FX formulas? Power App Maker Portal would give you the environment option to switch between environments, and I could access the solutions and create a new one. Given that the answer B is Powerapps Designer, that makes me think it's the application studio where your creating the app. This would not be where I access Envrionment/Solutions and would use the admin center to get to the environment so I can create a solution. right?

Admin Center does not have the Solutions option in the menu. In the Solution is mentioned the Power App Studio as the same thing as Power Apps Designer...
upvoted 7 times

gina_the_boss Most Recent 1 year, 7 months ago

The confusion must be from the "genius" naming convention that MS always makes. The more common name that I've seen is "Power Apps maker portal". They need to pick one name and stick with it

upvoted 2 times

noor9saleem 1 year, 7 months ago

not well articulated question, when it says solution package then it has to done using solution packager tool, but looks question is about from where solutions are moved from source environment to target environment, then it has to be Power Apps Designer, although Azure DevOps pipelines can also be used with Power Platform Build Tools to move solution but that is indirect answer, direct answer is "B"

upvoted 1 times

emily_kris 2 years ago

Copliot cites multiple Microsoft Learn articles, giving an answer of Power Platform Admin center. https://learn.microsoft.com/en-us/training/modules/manage-solutions-power-automate/4-import-export-solutionsFunny that Copilot can give completely different answers within a week. "The Power Platform admin center is primarily used for managing environments, monitoring resources, and setting up security roles and permissions. While it's a crucial tool for overall administration and governance, it doesn't provide the functionality to create and manage solution packages directly. The Power Apps designer is specifically designed for creating, managing, and exporting solutions, which can then be imported into different environments, making it the correct choice for this task."

To create a solution package for promoting components from the development environment to the user acceptance test environment, you should use the Power Apps designer. This tool allows you to create, manage, and export solutions that include components from Power Apps, Microsoft Dataverse, and Power Automate12. So, the correct answer is B. Power Apps designer.

upvoted 1 times

HAZZTA 2 years, 1 month ago

Rubbish question. You package a solution in the Maker portal unless you are doing it via a pipeline in devops, so technically A is correct, but DevOps and pipelines are not covered in PL-200.

upvoted 2 times

b304b2c 2 years, 3 months ago

Horribly written question. This is asking where to login to move solution packages from development environment to a UAT environment. Power Platform admin center is where you manage environments. You would still need to log into Power Apps and Power Automate to import the solutions.

upvoted 1 times

jkaur 2 years, 4 months ago

seems B

upvoted 1 times

MrEz 2 years, 7 months ago

maybe "Power App"- or "Power Platform", Power App Studio, maker platform, Power Apps Maker portal (also known as the Power Apps designer), many trivial names for the same thing?

upvoted 1 times

Joey444 2 years, 9 months ago

I think it is just poorly named. You create solutions in the maker portal, hence B in my opinion.

upvoted 3 times

Abdullah1993 3 years ago

How can it be Azure DevOps? It says nothing about deploying a solution using ALM.This is solution creation, has to be Maker. Where you build a new solution then add content.

Question #12 *Topic 2*

A company is creating a Power Apps solution for a production facility.
The current solution is in English. The customized components must be translated into several languages.
You need to extract the text for translation.
In which location can you achieve this goal?

A. The tables in the web application.

B. The selected environment in the Microsoft Power Platform admin center.

C. The solution in the web application.

D. The individual solution components in the web application.

Suggested Answer: *C*
Export the localizable text. The scope of the localizable text that will be exported is the unmanaged solution that contains the localizable text. 1. From Power Apps, select Solutions. 2. In the All Solutions list, select the unmanaged solution that contains the localizable text you want. 3. On the command bar, select Translations > Export Translations. Reference: https://docs.microsoft.com/en-us/powerapps/maker/model-driven-apps/translate-localizable-text

Question #13 *Topic 2*

You have a canvas app that allows users to view, select, and purchase products. The app uses a Gallery control to display products and checkboxes that allow users to select products.
When users select items from the product catalog, they move to a different screen to complete a purchase.
Users must be able to clear all product selections when they click the button.
You need to configure the button.
What should you do?

A. Use the Reload(Control) formula and pass the gallery control as parameter to the Reload formula.

B. Use the Reset(control) formula and pass the checkbox to the formula to clear user selections.

C. Set the OnCheck value to populate a collection and the OnUncheck value to remove the item from the collection. Clear the collection when the user selects the button.

D. Use the Revert(Products) formula and pass the checkbox to the formula to clear user selections.

E. Use the Reset(Control) formula and pass the gallery control as a parameter to the Reset formula.

Suggested Answer: *B*
The Reset function resets a control to its Default property value. Any user changes are discarded. You cannot reset controls that are within a Gallery or Edit form control from outside those controls. You can reset controls from formulas on controls within the same gallery or form.
Reference: https://docs.microsoft.com/en-us/powerapps/maker/canvas-apps/functions/function-reset

vishjust 5 years, 2 months ago
There are multiple checkbox control respect to gallery records. if "B" is correct then we need to give command from formulabar to all check boxes, isn't it? I think C still makes sense hereTrue, but I think when creating a gallery, you technically only need to add 1 checkbox. The control needs to be

added only once, to the gallery "template". The controls in the template is replicated for each item / record in the gallery. I have not tested this, but I believe if you reset the 1 checkbox control, it will reset each iteration of the checkbox in the gallery.https://docs.microsoft.com/en-us/power-apps/maker/canvas-apps/controls/control-galleryI have now tested it in canvas app. Adding 1 checkbox control will add 1 checkbox for each record iteration. Howere, the reset function cannot be used on controls inside a gallery from outside the gallery. https://docs.microsoft.com/en-us/power-platform/power-fx/reference/function-reset Have also tested using reset function on the gallery. However it does not affect the checkboxes in the gallery. I believe C is the only viable answer.

upvoted 12 times

Nyanne 3 years, 12 months ago

Question #14 *Topic 2*

A customer tracks events by using a custom entity.
The custom entity includes a custom field for the venue of the events. The customer must be able to display the events by venue in a calendar.
You need to ensure that all events display by venue in the calendar.
To which component should you add a control?

A. Form

B. Subgrid

C. Chart

D. View

Suggested Answer: *D*
If you use unified interface, you can display any record in a calendar view via the calendar control. 1. Go to Settings->Customization->Customize the System 2. Open the configuration for the entity that you want to use the calendar control (Opportunities in our example) 3. Click the View tab 4. Click ɔ€Add Controlɔ€ and select the calendar control. 5. Click the dot for every interface from which you want the calendar control to be available. Reference: https://crmtipoftheday.com/1206/view-any-dynamics-365-record-on-a-calendar/

Question #15 *Topic 2*

You are creating a canvas app.
A user will click a button on each screen of a Power Apps app to proceed to the next screen.
You need to implement the action which selects the next screen that the user sees.
Which event should you handle?

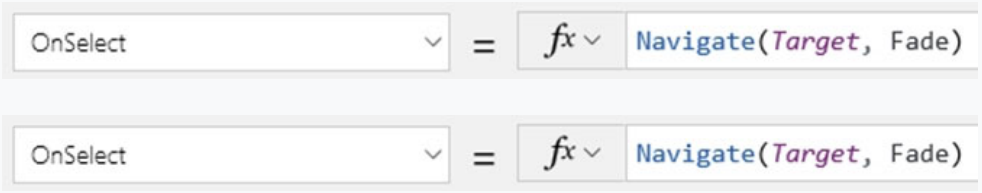
A. ScreenTransition

B. OnSelect

C. OnLoad

D. OnCheck

Suggested Answer: *B*



Add navigation - 1. With the Source screen selected, open the Insert tab, select Icons, and then select Next arrow. 2. With the arrow still selected, select the Action tab, and then select Navigate. 3. The OnSelect property for the arrow is automatically set to a Navigate function.

4. When a user selects the arrow, the Target screen fades in. 5. On the Target screen, add a Back arrow, and set its OnSelect property to this formula: 6. Navigate(Source, ScreenTransition.Fade) 7. While holding down the Alt key, toggle between screens by selecting the arrow on each screen. Reference: https://docs.microsoft.com/en-us/powerapps/maker/canvas-apps/add-screen-context-variables

Question #16 *Topic 2*

HOTSPOT -

A company has a canvas app that includes the following screens: Screen1 and Screen2.

The OnVisible property for Screen1 contains the following expression.

Set(AgeGroups, ["1-25", "26-54", "55+"])

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Statements	Yes	No
AgeGroups can be accessed from Screen1 and Screen2.	○	○
AgeGroups is a collection.	○	○
You can use the Update function to change values in AgeGroups.	○	○

Suggested Answer:

Answer Area

Question #19 *Topic 2*

A company is implementing Microsoft Power Platform solutions.
The company requests information on the features that are supported by Power Fx.
You need to identify the features of Power Fx.
What should you identify?

A. It is available for purchase through a Microsoft reseller.

B. It uses a plug-in.

C. It uses imperative and declarative logic.

D. It uses synchronous data operations.

Suggested Answer: *C*
Official Answer: C

Community vote distribution
C (100%)

cd32c1b Most Recent 1 year, 2 months ago
The correct answer is C. It uses imperative and declarative logic. why the other ones don't work A. It is available for purchase through a Microsoft reseller → Power Fx is free and open-source, not a purchasable product. B. It uses a plug-in → Power Fx is a low-code language, not a plug-in-based system. D. It uses synchronous data operations → Power Fx primarily works with asynchronous operations, especially when interacting with Dataverse.
upvoted 4 times

Question #20 *Topic 2*

You are configuring a new Power Apps portal. You have two web roles, one for authenticated users and one for anonymous users. You grant the Anonymous
Users role to users.
A test user reports that they can access the home page but cannot view a page linked from the home page.
You need to determine why the test user cannot view the portal page.
What is the cause of the issue?

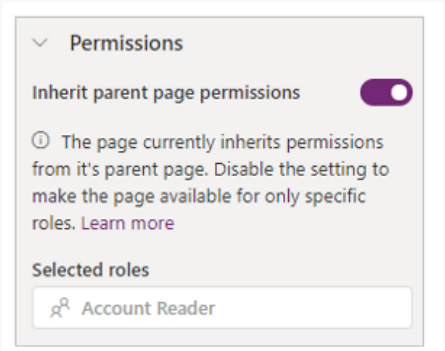
A. The setting to make the page available to everyone is disabled.

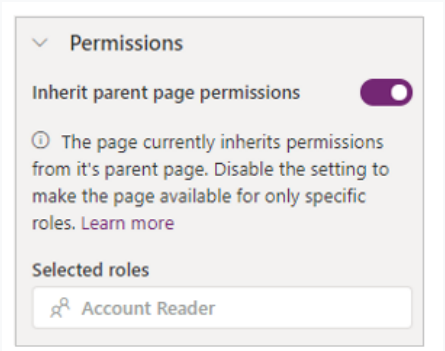
B. Inherited permissions are not enabled for the linked page.

C. The Authenticated Users Web role does not have permission to view the page.

D. Maintenance mode is enabled on the portal.

Suggested Answer: *B*





You use page permissions to control user access to portal webpages. For example, you can allow pages to be available anonymously for public access, or restrict access to users who have specific roles. Depending on business requirements, you can manage the inheritance of page permissions from a parent page to a child page. A page can have child web filesأ¢â€"such as downloadable documents, CSS files, or JS filesأ¢â€"and you can also manage the inheritance of page permissions from the page to such child web files. Note: Inherit permissions from a parent page Permissions section shows Inherit parent page permissions when a child page is selected that has the parent page with Page available to everyone set to Off.

A (65%) B (24%) C (12%)

Daniel_Lee Highly Voted 3 years, 10 months ago

Why can't A be the answer?

upvoted 10 times

cd32c1b Most Recent 1 year, 2 months ago

The correct answer is A. The setting to make the page available to everyone is disabled. Why? In Power Apps portals, pages can be configured to be available to everyone or restricted to specific web roles. If the setting to make the page available to everyone is disabled, anonymous users will not be able to access it. This setting is typically found in the Page Permissions section of the portal editor. Why Not the Other Options? B. Inherited permissions are not enabled for the linked page → While inherited permissions can affect child pages, the issue here is likely due to the explicit restriction of the page. C. The Authenticated Users Web role does not have permission to view the page → The test user is anonymous, so this role does not apply. D. Maintenance mode is enabled on the portal → If maintenance mode were enabled, the entire portal would be inaccessible, not just a single page.

upvoted 1 times

gina_the_boss 1 year, 7 months ago

Since the Anonymous User role is granted to users, and users can see the homepage already, that means the ANYONE CAN SEE THIS PAGE option is already ON on the homepage > the child page won't have the INHERITE PERMISSIONS FROM A PARENT PAGE available on the page, but only ANYONE CAN SEE THIS PAGE >> The correct answer must be A. "The option INHERITE PERMISSION FROM A PARENT PAGE is only available when a child page has a parent page with the ANYONE CAN SEE THIS PAGE option NOT selected." Ref: https://learn.microsoft.com/en-us/power-pages/security/page-security

upvoted 4 times

noor9saleem 1 year, 7 months ago

it looks A not B,

upvoted 1 times

killionb12 1 year, 8 months ago

The most likely cause of the issue is A. The setting to make the page available to everyone is disabled. In Power Apps portals, you need to explicitly set permissions for each page. If the linked page is not set to be available to everyone, users with the Anonymous Users role will not be able to view it

upvoted 2 times

5f14337 2 years ago

Setting to make the page available to everyone: If this setting is disabled, anonymous users (those with the Anonymous Users role) will not be able to view the page. This setting needs to be enabled to ensure that the page is accessible to all users, including those who are not authenticated.

upvoted 1 times

MrEz 2 years, 7 months ago

Power Pages = Power Pages Portal.

upvoted 1 times

MrEz 2 years, 7 months ago

i think b, but authenticated users are users too. "Inherit permissions from a parent page": This option is available when a child page has a parent page with the Anyone can see this page option not selected. and the other option is: Configure child page with unique permissions. if this one is selected and you are not a chosen one, then most probably you cannot access the page. even though the parent page is set to Anyone can see this page. if this one is selected and you are not part of the chosen ones, I think, you cannot see the child page. The setting to make the page available to everyone is disabled. The page = parent page or child page? Not clear. B. Inherited permissions are not enabled for the linked page. --> wording in settings is different!

upvoted 1 times

fcc68ed 2 years, 7 months ago

Is the web role portion of this question just a red herring? It isn't specified whether the "test user" is assigned the anonymous user or authenticated authenticated user web role so doesn't that mean the role is irrelevant?

upvoted 1 times

hismail 2 years, 8 months ago

Option B. Inherited permissions are not enabled for the linked page is not correct because inherited permissions only apply to child pages of a parent page, not to pages linked from another page. Inherited permissions allow you to control the access to a group of pages that share the same parent page. For example, if you have a parent page called Products and several child pages for different product categories, you can use inherited permissions to grant or restrict access to all the child pages based on the parent page.

upvoted 2 times

Ceddy 3 years, 1 month ago

It has to be B because the question does not specify whether the "test user" is an Authenticated and Anonymous user. And this was on exam 7-4-23

upvoted 3 times

charles879987 3 years, 3 months ago

A and C both incorrect because an access rule applies to all the child page. So you can't have half access and half restricted access from a parent page. B is correct.

HOTSPOT -

A company is configuring a Power Apps portal using Microsoft Dataverse.

The company requires the following:

✑ Only authenticated users must be able to sign into the portal.

✑ Authenticated users must have varying degrees of access to the different parts of the portal.

✑ Users must enter one of several external identities when creating an account during the open registration process.

You need to configure user authentication and permissions.

Which component should you use? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Configuration	Component
Required for each authenticated user before security can be assigned.	Contact table record Local user Microsoft work or school account Account table record
Required for authenticated users to access restricted pages of the portal.	Contact table record Local user Microsoft work or school account Web roles

Suggested Answer:

Answer Area

Configuration	Component
Required for each authenticated user before security can be assigned.	Contact table record
Required for authenticated users to access restricted pages of the portal.	Web roles

Answer Area

Configuration	Component
Required for each authenticated user before security can be assigned.	Contact table record
Required for authenticated users to access restricted pages of the portal.	Web roles

Box 1: Contact table record - In Power Apps portals, each authenticated portal user is associated with a contact record in Microsoft Dataverse.

Box 2: Web roles - Portal users must be assigned to web roles to gain permissions beyond unauthenticated users. Reference: https://docs.microsoft.com/en-us/powerapps/maker/portals/configure/configure-portal-authentication

DRAG DROP -

You create a new solution for a business process.

The business process includes uploading specific file types to a web service.

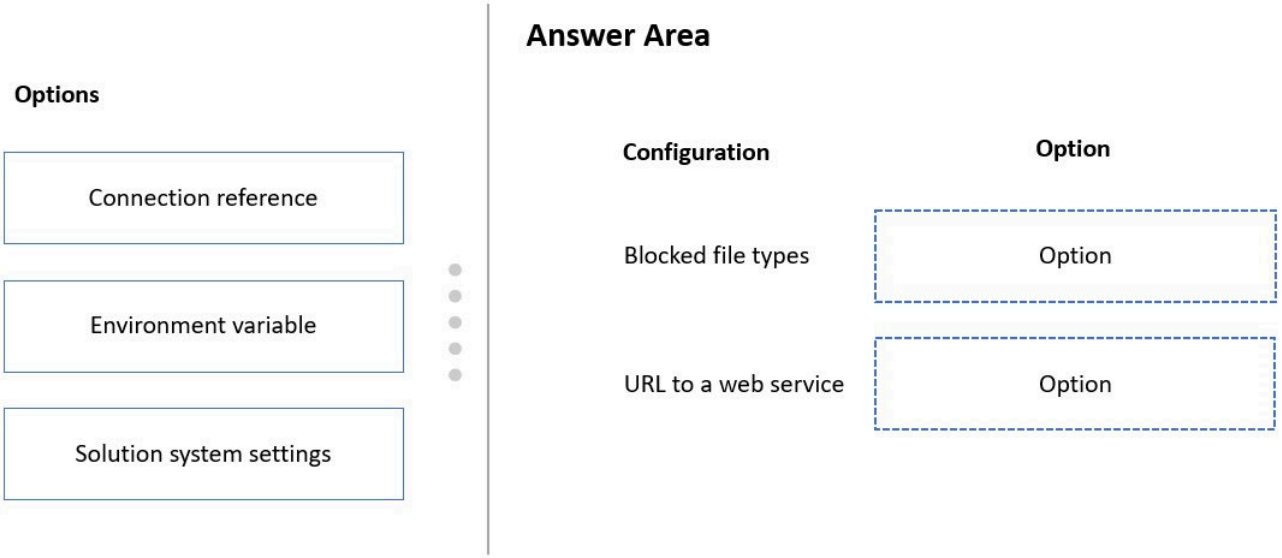
You need to ensure that the business process works the same way anywhere the solution is deployed.

Which option should you use? To answer, drag the appropriate options to the correct configurations. Each option may be used once, more than once, or not at all.

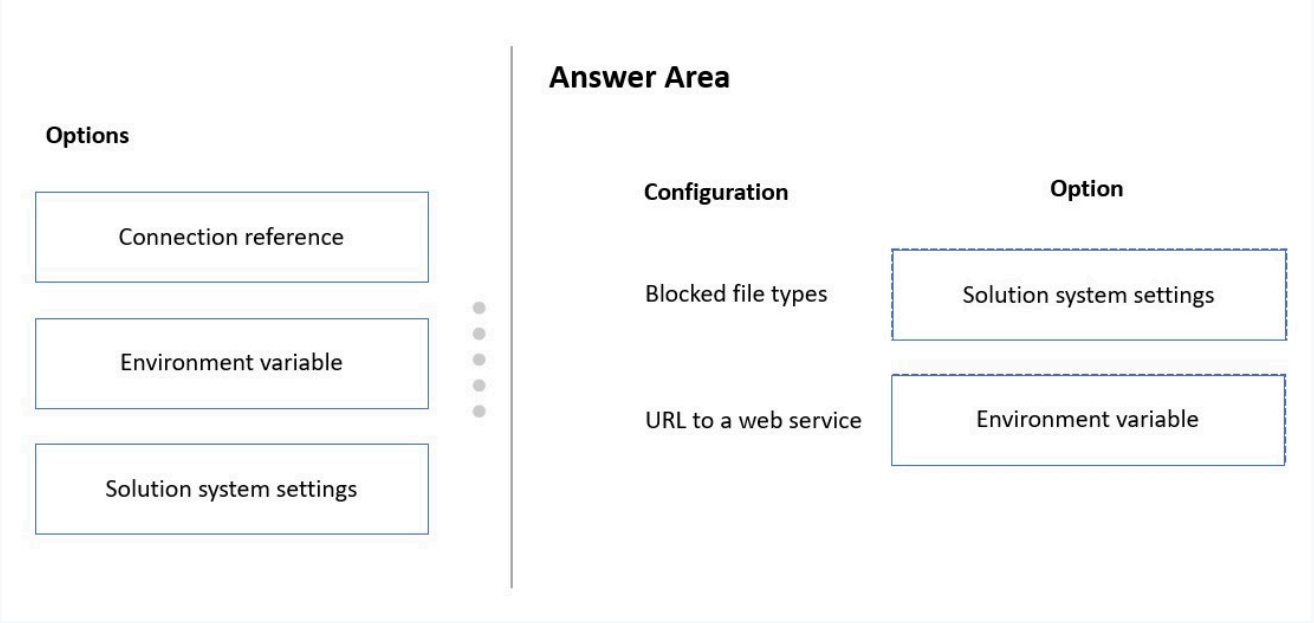
You may need to drag the split bar between panes or scroll to view content.

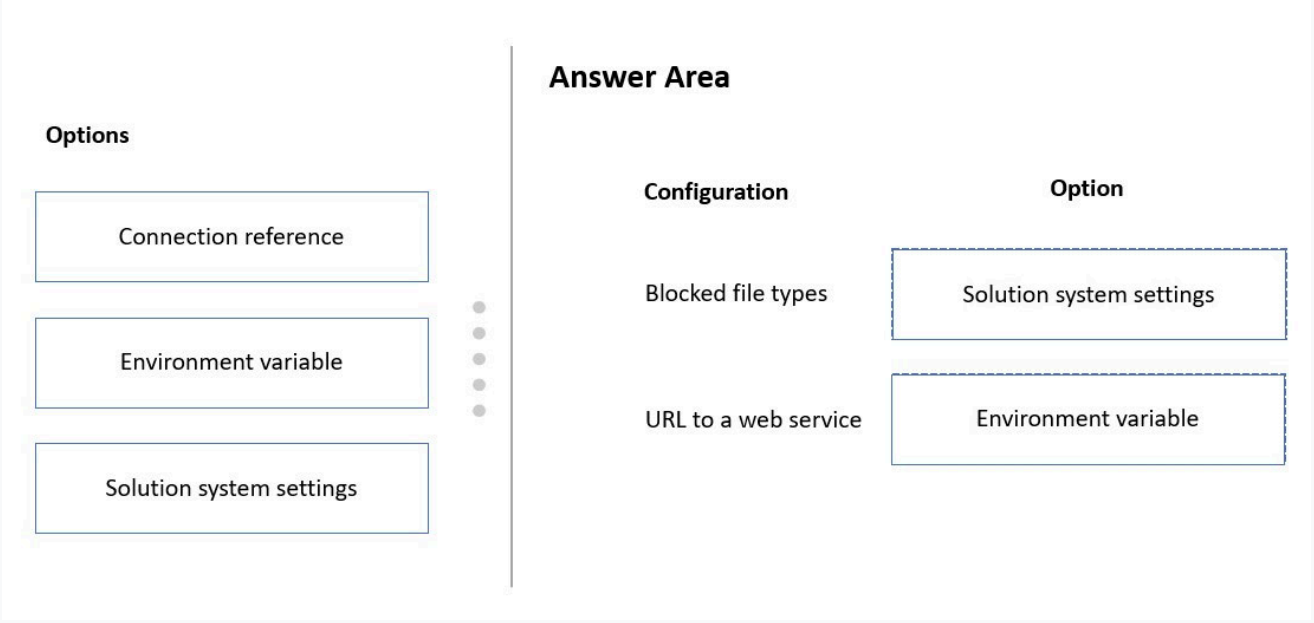
NOTE: Each correct selection is worth one point.

Select and Place:



Suggested Answer:





Box 1: Solution system settings - For Power Apps in Settings > Customizations > Customize the System you can configure email and document management, activate or deactivate processes, and more.

Box 2: Environment variable - When should Environment variables be used? Some examples include: When an input parameter needs to change across environments and should not be hard-coded. For example, a URL that points to a different resource in development and production environments. If you're building a solution where your customer is required to provide an input value. Application setup pages. Incorrect: A connection reference is a solution component that contains information about a connector. Reference: https://docs.microsoft.com/en-us/powerapps/maker/model-driven-apps/advanced-navigation https://powerapps.microsoft.com/en-us/blog/environment-variables-available-in-preview/

Nyanne 3 years, 4 months ago

How does one configure / specify blocked file types from solution system settings?... System settings are not even solution aware... My vote would be environment variable for both, simply because the question specifies "You need to ensure that the business process works the same anywhere the SOLUTION is deployed." Changes to system settings are not deployed to other environments. Environment variables are solution aware. https://learn.microsoft.com/en-us/power-apps/maker/data-platform/environmentvariablesCan environment variable block file types?Good point. It can't, I was thinking in terms of using a Flow and validating file types. But this is probably not what MS is asking..I thought of this as solution system settings : Power Platform Admin Center -> Environments -> Specific Environment -> Settings -> Pricacy + Security -> Blocked Attachments -> Block these file extensions.just tested it from: Power Platform Admin Center -> Environments -> Specific Environment -> Settings -> Pricacy + Security ->

Blocked Attachments -> Block these file extensions. it worked, and i double and trible checked if their remained with different settings. worked! thought i had to search for Privacy, security not found in the menue. then i opened every environment -> advanced settings - > solutions, publish All Customisations. back again to PPAdmin Center, checked every envriomemt, the blocked settins still differen (i thought, maybe the publish would overwrite it). but would deployment do? dev->test->prod?I deadass hope I don't get such questions in my exam tomorrow.Your answer seems right, from ChatGpt: - Blocked file types: Use an environment variable. This allows you to store information that varies between deployments, such as the types of files that are blocked. - URL to a web service: Use an environment variable. Your answer seems right, from ChatGpt: - Blocked file types: Use an environment variable. This allows you to store information that varies between deployments, such as the types of files that are blocked. - URL to a web service: Use an environment variable. This ensures that the URL to the web service is consistent across all environments where the solution is deployed. Environment variables are solution-aware, which means they are included when the solution is exported and imported into a different environment. This ensures that the business process works the same way anywhere the solution is deployed.

Question #23 *Topic 2*

A company collaborates by using Microsoft Teams.
You must create a Power Apps app directly from within a Teams channel. The app will be used by members of the channel to manage sales orders.
You need to create the app by using Dataverse for Teams.
How should you create the app?

A. Create a canvas app by using a Power Apps personal app in Teams.

B. Create a canvas app by using the App Studio app.

C. Use the Power Apps web designer.

D. Create a model-driven app by using the App Studio app.

Suggested Answer: *B*
You can create, edit, and delete canvas apps in Teams. Note: With Power Apps Studio embedded in the Power Apps app in Teams and the new built-in data platform providing an easy-to-use, editable data table, you can quickly build apps based on custom data tables that are Teams-specific and scenario-specific. Incorrect: Not A: A personal app is a Teams application that has a personal scope. Power Apps is by default available for you to select and add to a tab in the Teams channel of your choice. Reference: https://docs.microsoft.com/en-us/power-apps/teams/create-first-app https://docs.microsoft.com/en-us/power-apps/teams/create-apps-overview

create a Power Apps app DIRECTLY from within a Teams channel
upvoted 2 times

opai677147 3 years, 4 months ago
In Teams, go to the channel where you want to create the app. Click on the "+" icon on the left-hand side of the message box to add a new tab to the channel. Search for "Power Apps" in the search bar and select it from the list of available apps. If you haven't already, you will need to install the Dataverse for Teams app by clicking on "Add" and following the prompts. Once you have installed Dataverse for Teams, select it as the data source

for your app. Click on "Create a new app" and then select "Canvas" as the type of app you want to create. Choose a blank or pre-built template for your app. Customize your app by adding controls, screens, and other components using the Power Apps Studio interface. Once you have finished configuring your app, click "Save" to save your changes. The new tab with your Power App will now appear in your Teams channel.

upvoted 2 times

meet_satish 3 years, 5 months ago

Question #24 *Topic 2*

DRAG DROP -

A company has a portal. Users sign into the portal by using a social media account.

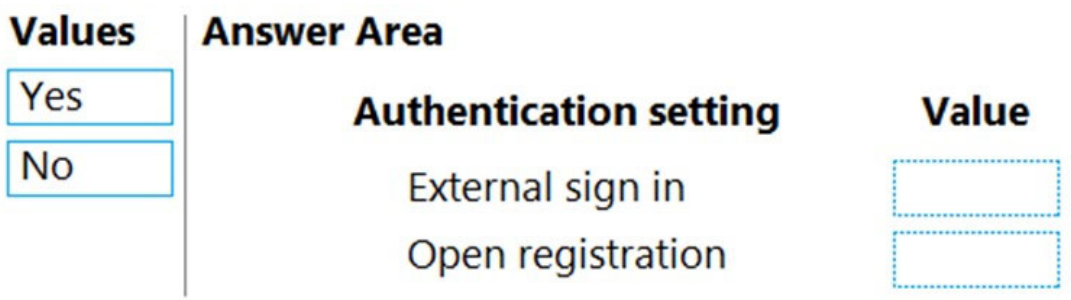
The company wants to replace the existing portal with a Power Apps portal. Users must sign up for access to the portal by using a Microsoft account and a unique invitation code that will be provided to the users.

You need to configure authentication for the home page.

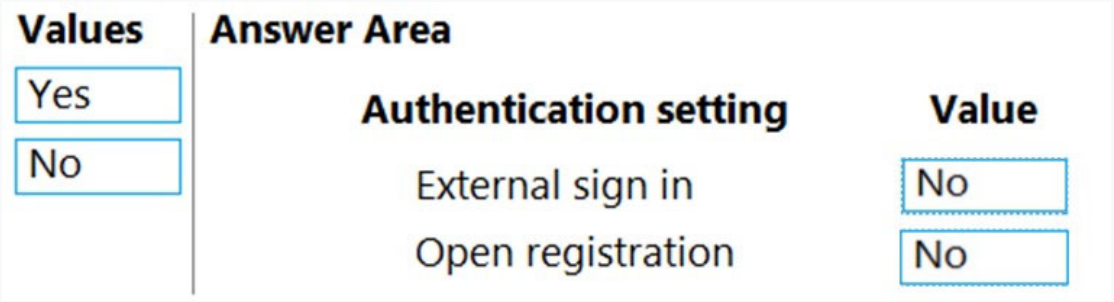
Which values should you use? To answer, drag the appropriate values to the appropriate authentication settings. Each value may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

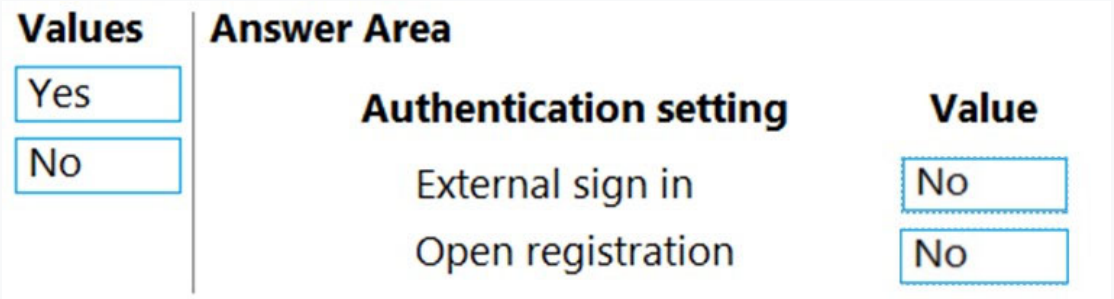
NOTE: Each correct selection is worth one point.

Select and Place:



Suggested Answer:





Box 1: No - External (social provider) user sign-in through third-party identity providers. Note: The portals feature provides authentication functionality built on the ASP.NET Identity API. ASP.NET Identity is in turn built on the OWIN framework, which is also an important component of the authentication system. The services provided include: Local (username/password) user sign-in External (social provider) user sign-in through third-party identity providers Two-factor authentication with email

Email address confirmation -

Password recovery - Invitation code sign-up for registering prepopulated contact records

Box 2: No - Authentication/Registration/OpenRegistrationEnabled - Enables or disables the sign-up registration form for creating all forms of users. The sign-up form allows any anonymous visitor to the portal to create a new user account. Default: true Reference: https://docs.microsoft.com/en-us/power-apps/maker/portals/configure/set-authentication-identity

DRAG DROP -

You are customizing a model-driven app for a company. You create a Theme template to ensure the company logo and colors are properly used within these apps.

The theme must meet the following requirements:

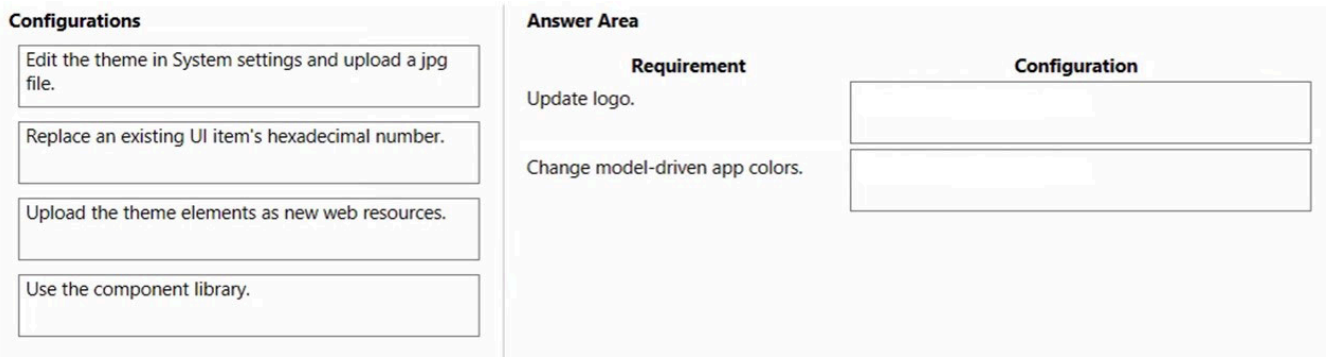
✑ Updated to add the logo

✑ Downloaded by the makers to create the app

You need to configure the assets. To answer, drag the appropriate configurations to the correct requirements. Each configuration may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Select and Place:



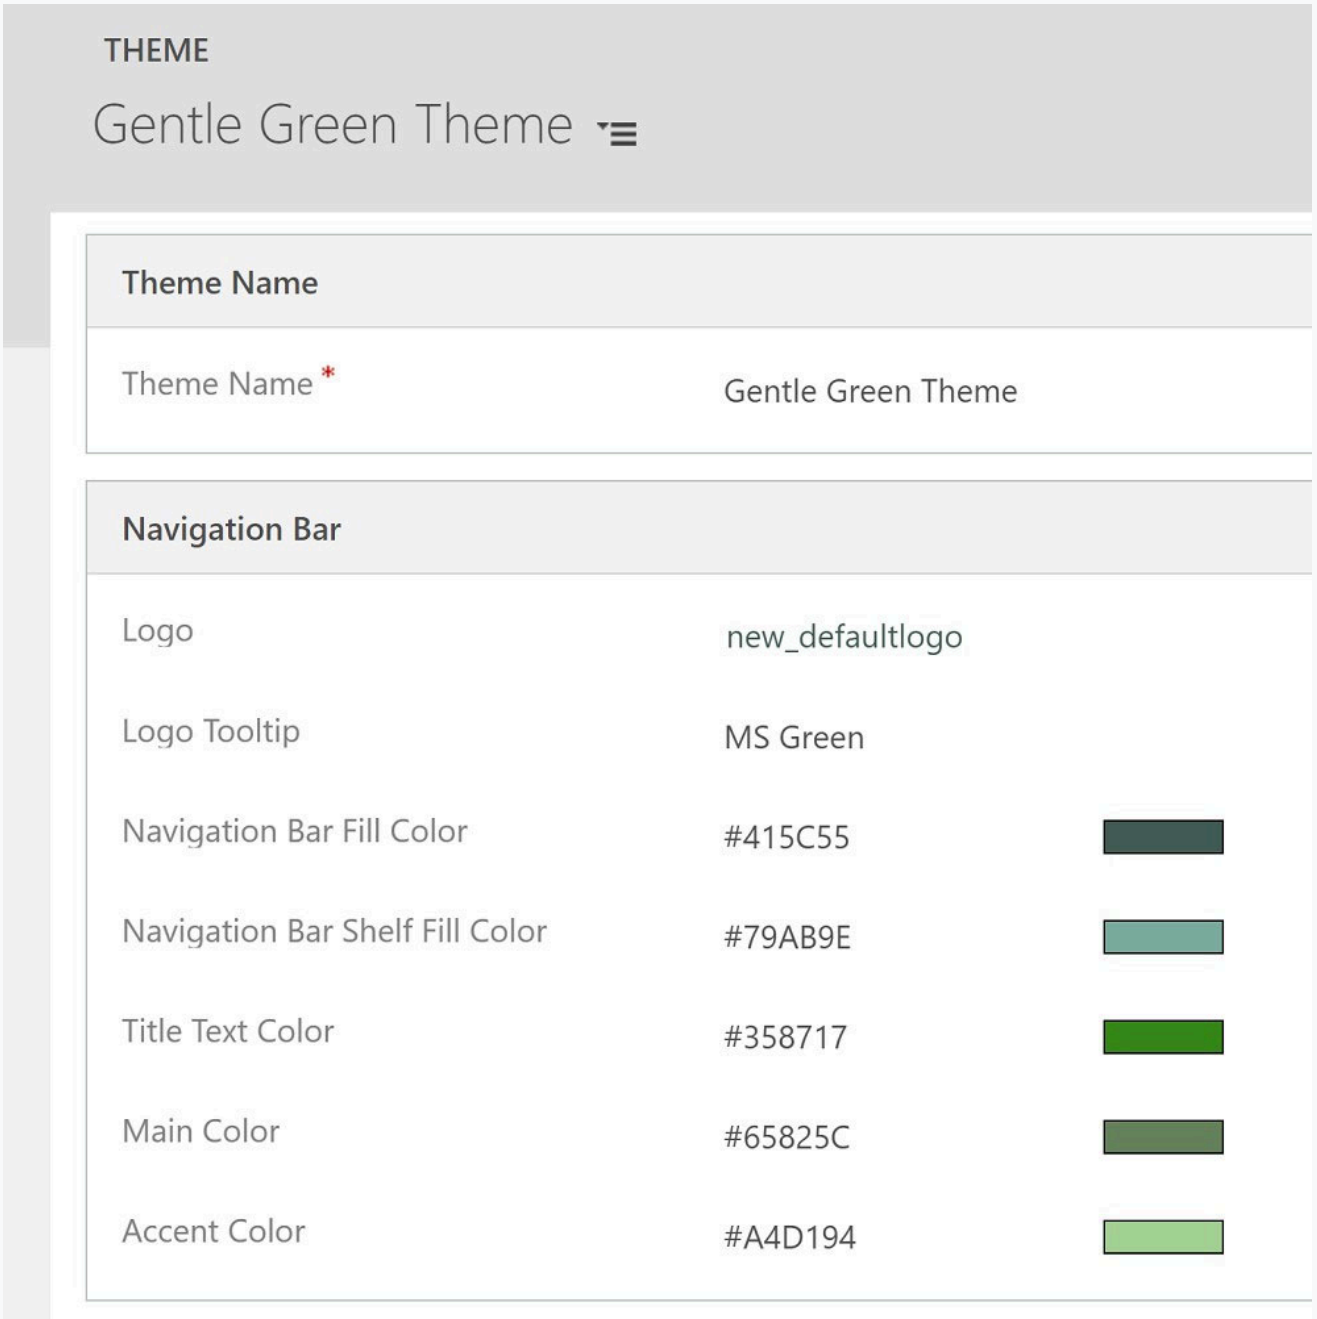
Suggested Answer:

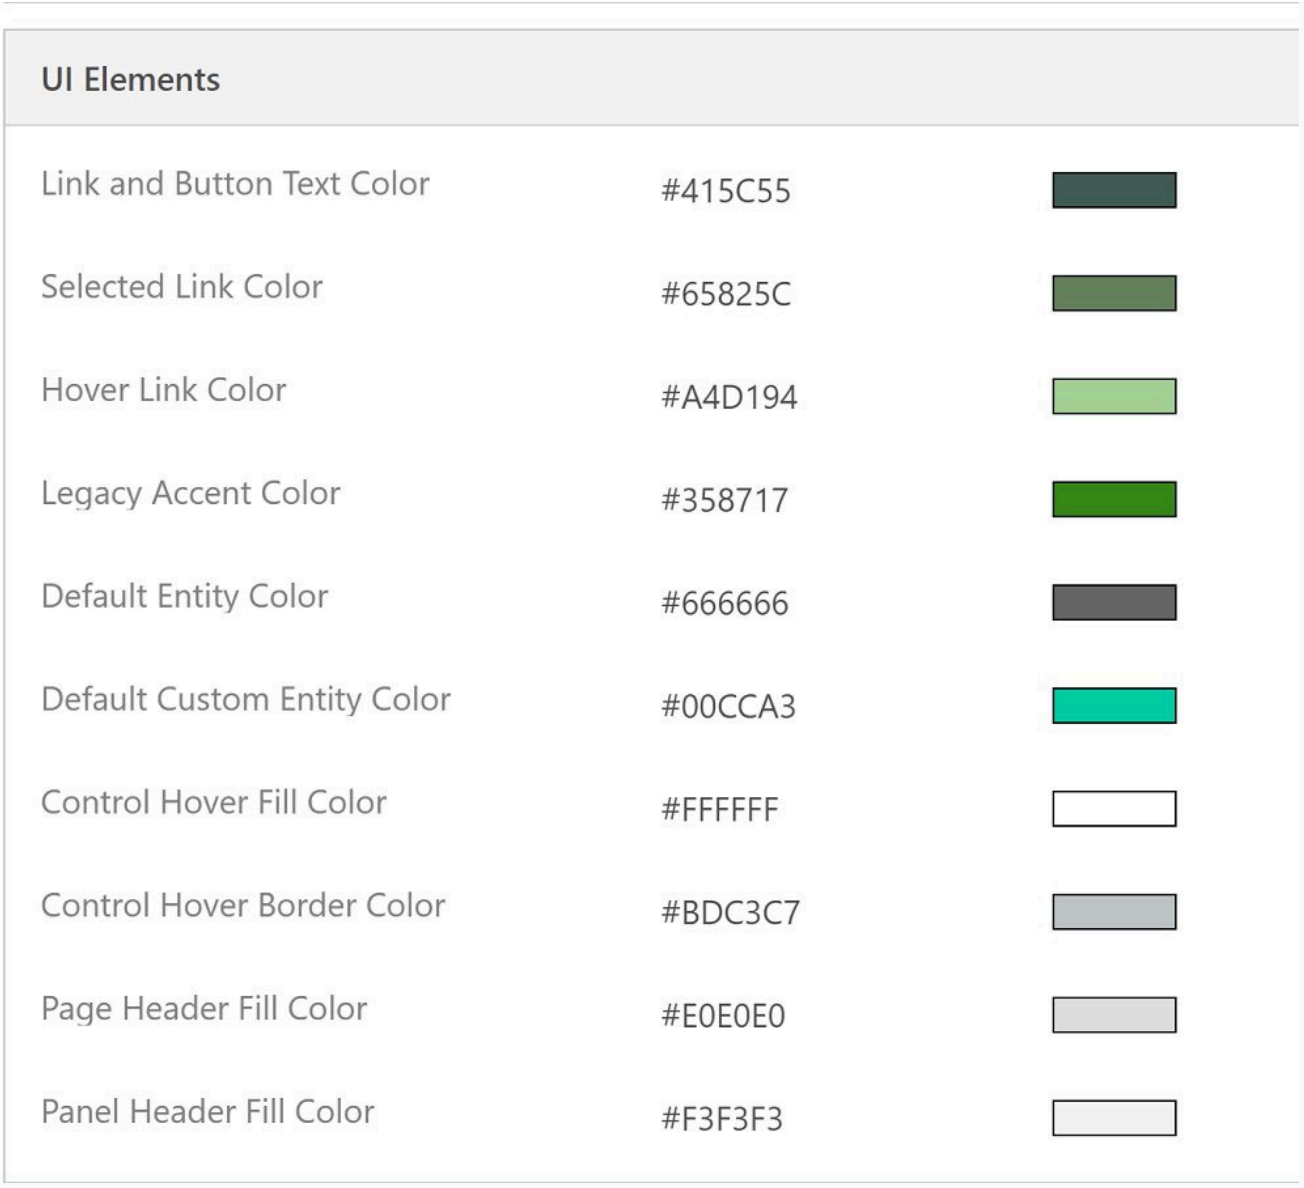
Configurations

- Edit the theme in System settings and upload a jpg file.
- Replace an existing UI item's hexadecimal number.
- Upload the theme elements as new web resources.
- Use the component library.

Answer Area

Requirement	Configuration
Update logo.	Upload the theme elements as new web resources.
Change model-driven app colors.	Replace an existing UI item's hexadecimal number.





Configurations

- Edit the theme in System settings and upload a jpg file.
- Replace an existing UI item's hexadecimal number.
- Upload the theme elements as new web resources.
- Use the component library.

Answer Area

Requirement	Configuration
Update logo.	Upload the theme elements as new web resources.
Change model-driven app colors.	Replace an existing UI item's hexadecimal number.

Box 1: Upload the theme elements as new web resources. Each type of icon is stored as a web resource. Create a web resource first and then set the icons to use them. Alternatively, you can add the icon by creating a new web resource when you define the table properties. Incorrect: * Not Edit the theme in System Settings and upload a jpg file. Box 2: Replace an existing UI item's hexadecimal number. Copy and alter the existing theme The easiest and quickest way to create a new theme is to clone and alter an existing theme. Then save, preview, and publish it. 1. Sign in to Power Apps, select Settings icon (upper right), and then select Advanced settings. 2. Select Customizations, and then select Themes. 3. Under All themes, select the theme you want to clone, such as the CRM Default Theme. Select Clone on the command bar. 4. Replace an existing UI item's hexadecimal number, such as the Title Text Color, with the hexadecimal value that represents the color you want. For example, the CRM Default Theme was cloned and changed using mostly varying shades of green color. The following screenshots show the new colors for navigation and highlighting. A custom logo was also added that will appear in the upper left corner of an app.

jkaur 2 years, 4 months ago

correct!

upvoted 3 times

MrEz 2 years, 7 months ago

depends if the logo already exisits and if the company has changed the logo. if so i would upload the jpg to the existing webresource (which can be done via edit theme logo.. pick the webresource, upload new file...). so upload jpg is not wrong. create new webresource if there is no (such) logo exisiting (if company has many logos), which can be done via edit theme, upload logo (by creating a new webresource of course). ... upload theme elements...? not sure. Still i would go for webresource and replace hex codes. I guess they want to test what good webresources are for...

upvoted 1 times

JohnChung 2 years, 8 months ago

The answers are correct. 1- Uploads a JPG file to update the logo. Web resources include image and HTML files 2- Replace an exist hexadecimal Number https://learn.microsoft.com/en-us/power-apps/maker/model-driven-apps/web-resource-properties-legacy https://learn.microsoft.com/en-us/power-apps/maker/model-driven-apps/create-themes-organization-branding

Question #26 *Topic 2*

A user needs to create a Power Apps portal app.
The user is getting a permission denied error when creating the portal app.
You need to configure permissions to create the portal app.
Which three permissions should you configure? Each correct answer presents part of the solution.
NOTE: Each correct selection is worth one point.

A. In the Power Platform admin center, ensure that the user account has read-write access.

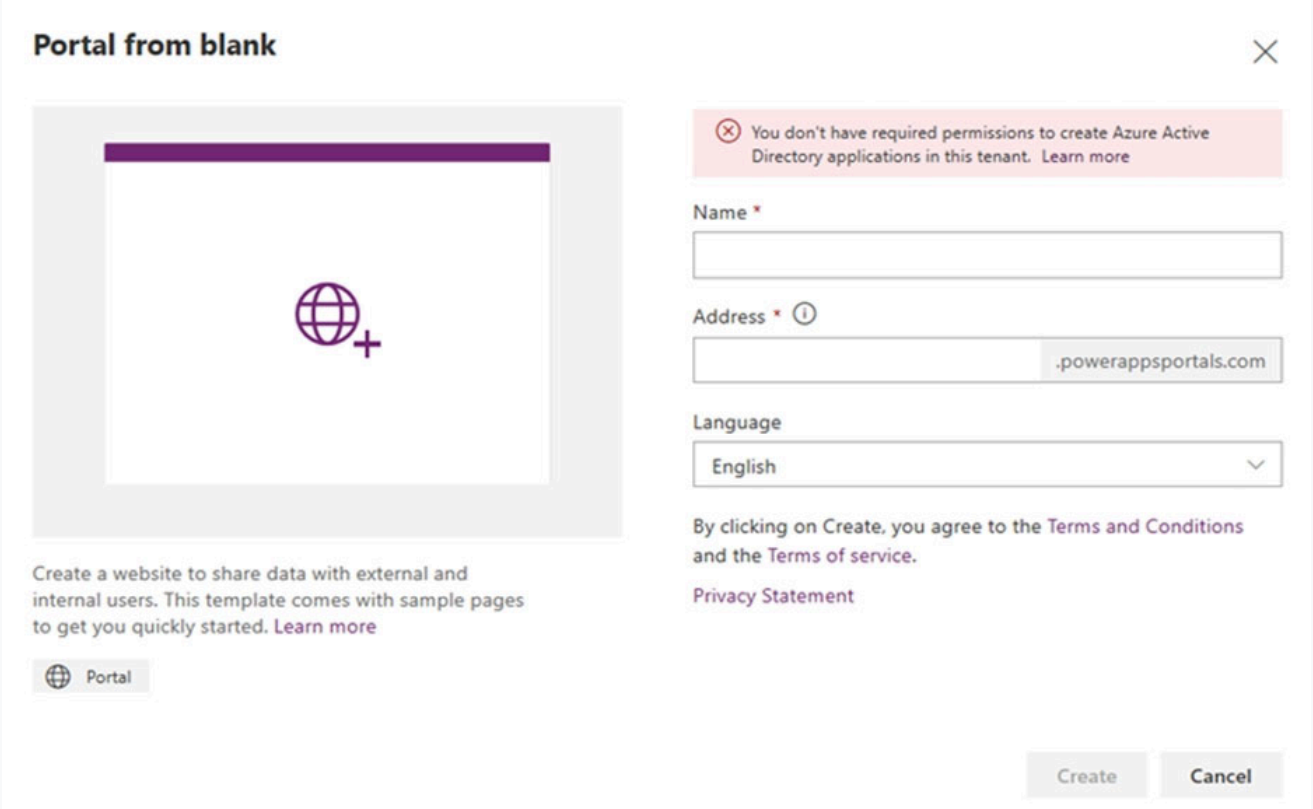
B. In Azure Active Directory, assign the Contributor role to the application at the subscription scope.

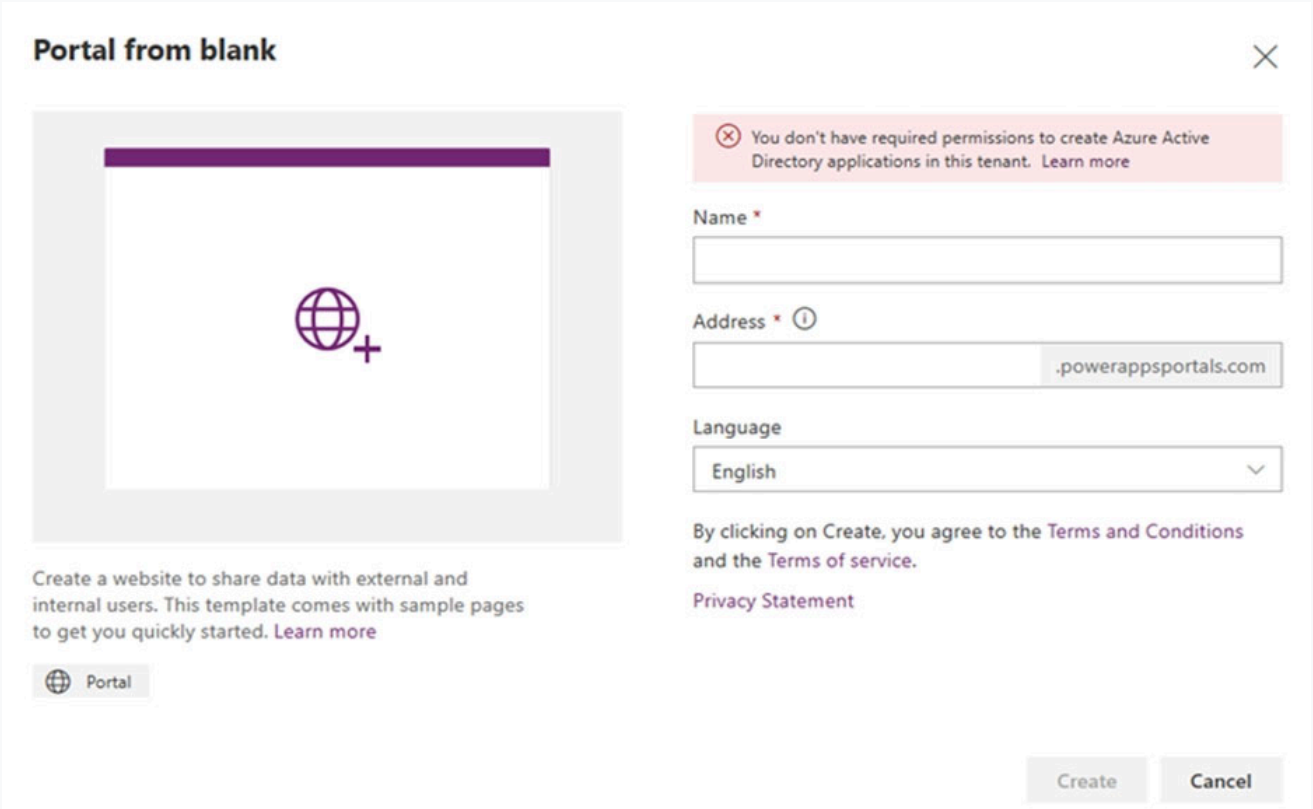
C. In Azure Active Directory, ensure that the user has permission to register an app.

D. In the Power Platform admin center, change the portal app owner to the user.

E. In the Power Platform admin center, ensure that the user has the System administrator security role.

Suggested Answer: *A, C, E*





AE: If you don't have sufficient privileges to provision a portal, an error is displayed. You must have the System Administrator role in Dataverse to create a portal. You must also have the Access Mode set to Read-Write under Client Access License (CAL) Information in the user record. C: No permissions to create Azure Active Directory application When you create a portal, portal as a new application is registered in Azure Active Directory associated with the tenant. If you don't have sufficient permissions to register an application with your Azure Active Directory tenant, you'll see an error as follows:

To create and register applications in Azure Active Directory, you must contact your tenant administrator to turn on the App registrations setting for your tenant. Note: If the app registrations setting is set to No, only users with an administrator role may register these types of applications. See Azure AD built-in roles to learn about available administrator roles and the specific permissions in Azure AD that are given to each role. If

your account is assigned the User role, but the app registration setting is limited to admin users, ask your administrator to either assign you one of the administrator roles that can create and manage all aspects of app registrations, or to enable users to register apps. Required roles and permissions in Microsoft Power Platform (all are required): - A user account with Read-Write Access Mode. - System administrator role. - Permissions to register an app in Azure AD are required. - Is website creation disabled in the tenant? - If Yes, in addition to the roles and permissions above, a user will also need at least one of the following roles to create a website: Global administrator, Dynamics 365 administrator, or Power Platform administrator.

HOTSPOT -

You have a Power Apps portal app that supports a sales community and a service community in the same environment. The only language configured in the environment is English. The company wants to add support for two more languages.

The solution must meet the following requirements:

✑ Languages must be for both sales and service functions.

✑ The company logo and colors must be used and apply to all screens.

✑ Communities must be separate with different URLs and access lists.

You need to configure the solution.

What should you configure? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Requirement	**Configuration**
Languages	Create two portals, one for each community. Create three portals, one for each language. Create one portal and import translations. Create six portals, one for each combination of language and community.
Company logo and colors	Add themes. Add web resources. Add a portal header and footer

Suggested Answer:

Answer Area

Requirement	Configuration
Languages	Create two portals, one for each community. / Create three portals, one for each language. / Create one portal and import translations. / Create six portals, one for each combination of language and community.
Company logo and colors	Add themes. / Add web resources. / Add a portal header and footer

Answer Area

Requirement	Configuration
Languages	Create two portals, one for each community. / Create three portals, one for each language. / Create one portal and import translations. / Create six portals, one for each combination of language and community.
Company logo and colors	Add themes. / Add web resources. / Add a portal header and footer

Box 1: Create two portals, one for each community

Power Apps portal app languages -

Box 2: Add themes - You can create a custom look and feel (a theme), for your app by making changes to the default colors and visual elements provided in the uncustomized system. For example, you can create your personal product branding by adding a company logo and providing table-specific coloring. A theme can be created by using the Themes area, without requiring a developer to write code. You can create, clone, change, or delete themes that are used in your environment. to exclusively meet the requirment "languages" which is the case here, 1 portal is okay. URLs can be redirected, bindings, ect. maybe another requirement (not part of this question) would let me use 2 portals in practice (e.g. mainenance, further developments, with 2 portals you can still access the same data)

upvoted 1 times

fariasalan86 3 years ago

Communities must be separate with different URLs and access lists. Two Portals

upvoted 1 times

fuddyduddy 3 years ago

This is poorly worded because the question states that there is already a portal. >>You have a Power Apps portal app that supports a sales community and a service community in the same environment. The only language configured in the environment is English. The company wants to add support for two more languages. To add languages for an existing portal, you enable the languages in the environment and then import. Source: https://learn.microsoft.com/en-us/power-apps/maker/portals/configure/enable-multiple-language-support You can have multiple bindings on a website. So a single website would do that. Different access list are required. AFAIK, different web roles can be added to same web site too. So there is no need to create another portal. Who comes up with these questions?Agreed! Another annoying question. Technically both Create two portals, one for each community and Create one portal and import translation satisfy the reqs.

upvoted 4 times

upvoted 1 times

_Nuni 3 years, 3 months ago

Given answer is correct! There are 3 requirements here: • Languages must be for both sales and service functions • The company logo and colors must be used to apply to all screens • Communities must be separate with different URLs and access lists The question asks for two requirements to be solved: Languages and Company Logo and Colors The answer is a trick question, because it assumes you know that you don't need to create separate portals for languages. The answer is solving the unmentioned requirement, but it also works for the languages requirement because a single portal can support multiple languages out-of-the-box. https://learn.microsoft.com/en-us/power-apps/maker/portals/configure/enable-multiple-language-support

DRAG DROP -

A company is creating a canvas app and a model-driven app to manage their customer accounts.

The canvas app requires a business rule to set the Business Type column to large if the customer size is greater than a specific currency value.

The model-driven app requires a business rule to recommend the account rating be re-evaluated when the account goes on credit hold for this app only.

You need to configure the scope for the business rules.

Which scope should you use? To answer, drag the appropriate scopes to the correct business rules. Each scope may be used once, more than once, or not at all.

You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Select and Place:

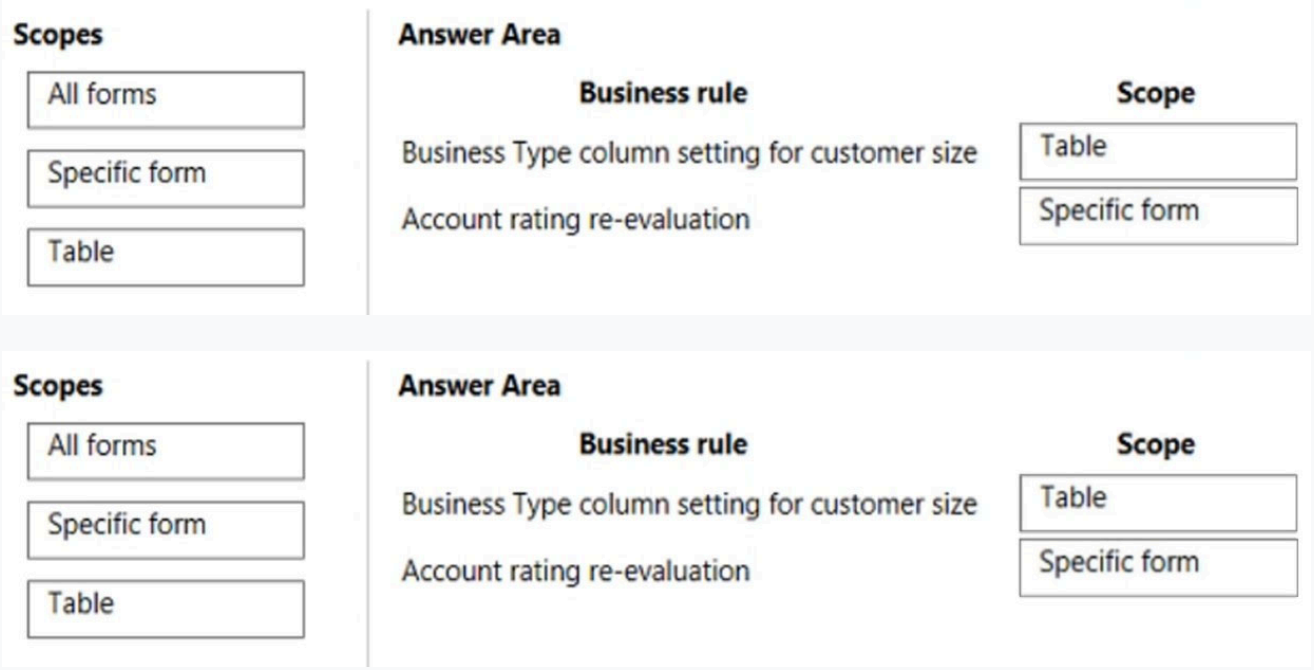
Scopes

- All forms
- Specific form
- Table

Answer Area

Business rule	Scope
Business Type column setting for customer size	
Account rating re-evaluation	

Suggested Answer:



Box 1: Table - The canvas app requires a business rule to set the Business Type column to large if the customer size is greater than a specific currency value. Scope the business rule to Entity (Table). Incorrect: Business rules in canvas app does not work on edit and detail forms. Business rules does not work on edit/ view forms in canvas app Rules like show/hide, enable/disable have no effect on in canvas app. Business rules are enforced while interacting with the data.

Box 2: Specific form - The model-driven app requires a business rule to recommend the account rating be re-evaluated when the account goes on credit hold for this app only.

For Model - The scope of the business rule determines which forms the business rule will be applied. You set the scope, according to the following: If you select this item... The scope is set to... Entity- The table and all forms for the table All Forms- All forms for the table Specific form (account Main Form, for example) - Just that form Reference: https://debajmecrm.com/business-rules-in-powerapps-canvas-apps/ https://docs.microsoft.com/en-us/power-apps/maker/model-driven-apps/create-business-rules-recommendations-apply-logic-form

I believe "filtered view" for the "Product removal" is the correct answer. Since products might be already used, they'd be better deactivated and not deleted, but alternatively with a filtered view on created on you can filter older products, otherwise data will be lost, connections might be left orphans

and restrict deletion of custom entities might exist leading to an unsuccessful deletion.It's a better practice to deactivate. However, the question specifies: Annually "remove" products that were created over a year agoAnd what about relationships that restrict product deletion? Will bulk deletion finally work? It's not that simple, but you might be right.

Question #30 *Topic 2*

A company creates a canvas app.
The app requires users to enter their social security number. The app should only display the last four digits when the user tabs to a different column.
You need to configure the app.
Which option should you use?

A. Business rule

B. Business process flow

C. Power BI DAX

D. Power Fx

Suggested Answer: *D*
Official Answer: D

Community vote distribution

RichXP Highly Voted 3 years, 6 months ago

Selected Answer: D

correct, add a calculated column with power fx to have last four digits ssn.

upvoted 9 times

RichXP Highly Voted 3 years, 6 months ago

correct, add a calculated column with power fx to have last four digits ssn.Alsfo from ChatGpt: the correct option is D. Power Fx. Power Fx is a low-code programming language for expressing logic across the Microsoft Power Platform. It is used in canvas apps to create and manipulate data, control behavior, and do a lot more. In this case, you can use Power Fx to create a formula that masks the Social Security Number and only displays the last four digits when the user tabs to a different column. The other options are not suitable for this specific requirement. Business rules and business process flows are used for enforcing and guiding users through business processes, while Power BI DAX is used for data analysis in Power BI.

upvoted 5 times

5f14337 Most Recent 2 years ago

To achieve the functionality where the app only displays the last four digits of the social security number when the user tabs to a different column, you should use **Power Fx** (Option D). Power Fx is the formula language for canvas apps in Power Apps, and it allows you to manipulate and format data dynamically. You can use it to create a formula that masks the social security number except for the last four digits.

upvoted 1 times

Moond0g 2 years, 12 months ago

Using Power Fx to directly manipulate the display of the last four digits of the social security number is a more straightforward and appropriate approach for this specific requirement. In the scenario described, where you want to display only the last four digits of a social security number when the user tabs to a different column, using a business rule might be an over-complication. Business rules usually deal with actions like showing/hiding fields, setting default values, or validating data. the "Business rule" option could be a valid choice in this context. Business rules in Power Apps can help enforce data validation, apply logic, and automate certain behaviours based on conditions. However, business rules are typically used for more complex scenarios that involve data validation and logic, rather than directly manipulating how data is displayed.

Question #31 *Topic 2*

A company uses Power Apps.
The company plans to create a canvas app that uses a responsive design.
You need to configure the app.
Which two actions should you perform? Each correct answer presents part of the solution.
NOTE: Each correct selection is worth one point.

A. Disable the Scale to fit setting.

B. Configure the height and width properties by using drag handles.

C. Enable the lock orientation setting.

D. Configure the height and width properties by using a formula.

Suggested Answer: *A, D*
Official Answer: AD

Community vote distribution
AD (88%) BD (12%)

fuddyduddy Highly Voted 3 years, 6 months ago
Agreed A & D. A because: You activate responsiveness by turning off the app's Scale to fit setting, which is on by default. When you turn this setting off, you also turn off Lock aspect ratio because you're no longer designing for a specific screen shape. (You can still specify whether your app supports device rotation.) Source: https://learn.microsoft.com/en-us/power-apps/maker/canvas-apps/create-responsive-layout#disable-scale-to-fit D because: To make your app's layouts respond to changes in the screen dimensions, you'll write formulas that use the Width and Height properties of the screen. Source: https://learn.microsoft.com/en-us/power-apps/maker/canvas-apps/create-responsive-layout#understand-app-and-screen-dimensions
upvoted 10 times

5f14337 Most Recent 2 years ago
A. Disable the Scale to fit setting. Disabling the "Scale to fit" setting ensures that the app adjusts to different screen sizes without scaling the content to fit the screen. This allows the layout to be more flexible and responsive. D. Configure the height and width properties by using a formula. Using formulas to set the height and width properties enables the app to dynamically adjust based on the screen size. You can use formulas like Parent.Width and Parent.Height to make controls responsive to the container or screen size.

This is what Microsoft say on their portal: Before you start using the responsive layouts, you need to do the following: Go to Power Apps. Open the app where you want to use the responsive layout. Go to Settings > Display to DISABLE Scale to fit, Lock aspect ratio, and Lock orientation and select

Apply. So I dont think the answer is complete here.

To create a canvas app with a responsive design in Power Apps, you should: B. Configure the height and width properties by using drag handles. D. Configure the height and width properties by using a formula. Explanation: To create a responsive design in Power Apps, you should use the drag handles to configure the height and width properties of the app's elements. You can also use formulas to dynamically adjust the size and position of the elements based on the screen size. Disabling the Scale to fit setting and enabling the lock orientation setting are not necessary for creating a responsive design, so options A and C are not correct.I believe this to be incorrect, The answers in the question i think are correct. A & D
upvoted 2 times

Question #32 *Topic 2*

A company uses model-driven apps.
Users in the sales department enter the first name, last name, and phone number of customers in the app. The users request a single screen in the app to enter the customer data.
You need to configure the app.
What should you do?

A. Create a Power Automate flow.

B. Use a Power Virtual Agents app.

C. Create a canvas app.

D. Modify the site map.

Suggested Answer: *C*
Official Answer: C

Community vote distribution

RichXP Highly Voted 3 years ago
correct for sureCorrect also for Chat GPT: The correct answer is C. Create a canvas app. Canvas apps in Power Apps allow you to create an application from scratch, starting with a blank canvas. They are highly customizable and can be designed to fit the specific needs of your users. In this case, a canvas app would allow you to create a single screen where sales department users can enter the first name, last name, and phone number of customers. This would fulfill the users' request for a single screen to enter customer data. The other options are not as suitable: A. Power Automate is used for automating workflows across applications and services, not for creating user interfaces. B. Power Virtual Agents are used to create chatbots, not user interfaces for data entry. D. Modifying the site map would change the navigation of the app, but it wouldn't create a new screen for data entry.I don't get it, they use a model-driven app, why would you create a canvas app? Can't you just modify the site map? For the chatGPT it's D.Chat GPT made a mistakes. You couldn't modify the site map to get a single screen.

upvoted 2 times

nessus 1 year, 3 months ago

Model-driven apps use a site map to control navigation between different areas, including forms, views, and dashboards. If users want a single screen (such as a dedicated form) to enter customer data (first name, last name, phone number), you can add or highlight that form in the site map, so it's easily accessible. This does not require switching to a canvas app, unless you need a custom layout.

upvoted 1 times

killionb12 1 year, 7 months ago

To configure the app so that users in the sales department can enter customer data on a single screen, you should: D. Modify the site map By modifying the site map, you can create a streamlined navigation experience that directs users to a single form where they can enter the first name, last name, and phone number of customers. This approach ensures that the data entry process is efficient and user-friendly

Question #33 *Topic 2*

You create a Power Apps app for Microsoft Teams using Microsoft Dataverse for Teams.
Users report that they are unable to view the app in Teams.
You need to ensure that users can access the app.
What should you do?

A. Share the app with a security group by using the Maker portal.

B. Publish the app by using the Maker portal.

C. Request that a tenant administrator pin the app to the app bar in Teams.

D. Share the app with a security group in Teams.

E. Share the app with individual users by using the Maker portal.

Suggested Answer: *D*
Official Answer: D

Community vote distribution

survivor Most Recent 1 year, 6 months ago
the requirement is to ensure access, not visibility. " You need to ensure that users can access the app." "Assign the colleagues with access role to a security group and share the app After you've completed setting the permissions to all your tables, you're now ready to share the app with an existing security group." https://learn.microsoft.com/en-us/power-apps/teams/set-perms-and-share
upvoted 3 times

killionb12 1 year, 8 months ago
No, you do not publish a Teams app using Dataverse for Teams through the Maker portal. Instead, you publish it directly within Microsoft Teams. Here are the steps: Create and Customize the App: Build your app using Power Apps within the Teams environment. Publish the App: In Teams, go to the Power Apps app, select your app, and click on the "Publish to Teams" option. This will make the app available to the team. Add the App to a Channel: Choose the channel where you want to add the app as a tab and save your changes. Yes, after publishing the app in Microsoft Teams, you should share it with the appropriate security group to control access. Here's how you can do it: Publish the App: Ensure the app is published in Teams as described earlier. Share the App: Go to the Power Apps app within Teams. Select the app you want to share. Click on the "Share" button. Add the security group or individual users you want to grant access to.
upvoted 2 times

33a7f9e 1 year, 10 months ago
Copilot suggested B and I asked why not D?. This was the response "Sharing the app with a security group in Teams is indeed a valid approach for managing access. However, the key step to ensure users can view and use the app in Teams is to publish the app. Publishing makes the app available and visible to users within Teams1. Sharing the app with a security group can be done after publishing to manage who has access, but it won't make the app visible if it hasn't been published first"
upvoted 2 times

5f14337 2 years ago
Share the app with a security group in Teams (Option D). This ensures that the appropriate users have access to the app within Teams

d for me. 1) do they mean 'personal Power App' in microsoft teams or 'Power App' not very clear. 2) (still not clear to me) could you make a 'personal Power App' for MS Teams Dataverse in the maker portal? Maybe this is the point they want to test (since 3 invalid options suggest Maker portal). If question is about "personal Power App" [referring to an app that is designed for individual use within Microsoft Teams, utilizing Dataverse for Teams,

the process is integrated into the Teams environment]: maker not suitable. Remaining C or D. Sharing more appropriate as there is no requirement 'ALL users', just users access it.

upvoted 1 times

Joey444 2 years, 9 months ago

Correct answer is D After you click share, you get a pop up with: "Enter or select a security group" https://learn.microsoft.com/en-us/power-apps/teams/set-perms-and-shareCorrect D also for ChatGpt: To ensure that users can access the Power Apps app in Teams, you should share the app with a security group in Teams. Here are the steps to do so: 1. Assign the correct permissions for the tables in your app for the Colleagues with access role. 2. Select a security group you would like to assign to the Colleagues with access role1. 3. Choose which apps the Colleagues with access role should have access to. 4. Once you're done sharing your apps, they'll appear in the Built for your colleagues section within the Teams app store. So, the correct answer is D. Share the app with a security group in Teams.

Option C suggests requesting a tenant administrator to pin the app to the app bar in Teams. This action would make the app easily accessible for all users in the organization. Option D suggests sharing the app with a security group in Teams. While this action can provide access to the app for the specified security group, it may not address the issue of app visibility for all users.The word 'all' is missing in the question. it is users plural but it does not necessarily mean that all users have to get access. So the point you mention has directed me away from C towards D. I hope they will make better questions where we would not have to wonder and figure out how things are meant. 'some users' or 'all users' should have been part of the question so that we are able to respond correctly.

D. Share the app with a security group in Teams. This is the correct approach because once an app is created in Microsoft Dataverse for Teams, you can share it with specific people or security groups directly in Teams. Remember that Microsoft Dataverse for Teams apps are automatically published when they're saved, so there's no need to separately publish them like you would in the Power Apps Maker portal. It is not B because when you create a Power Apps app specifically for Teams using Microsoft Dataverse for Teams, you don't use the Maker portal to publish it. Instead, you

publish the app directly within Teams. The previous provided link helps: https://learn.microsoft.com/en-us/power-apps/teams/dataverse-for-teams-table-permissions

tried all the scenarios. A. Share the app with a security group by using the Maker portal. Not possible with Teams. you choose what apps to add to Teams not share. B. Publish the app by using the Maker portal. no. apps are published in Teams portal C. Request that a tenant administrator pin the app to the app bar in Teams. yes. you can pin an app to Team Channel. D. Share the app with a security group in Teams. no. apps are not shared but added to Teams by admin. security groups not in teams but onedrive and sharepoint in ms 365. E. Share the app with individual users by using the Maker portal. no. app are added not shared to teams

upvoted 4 times

opai677147 3 years, 4 months ago

Answer from chatGPT B. Publish the app by using the Maker portal. If the app has been created using Microsoft Dataverse for Teams, it must be published in order for users to be able to access it in Teams. Sharing the app with a security group or individual users is not sufficient to make the app visible in Teams. Requesting that a tenant administrator pin the app to the app bar in Teams may improve visibility, but the app still needs to be published in the Maker portal.

upvoted 3 times

MicrosoftTheFuture 3 years, 5 months ago

answer: D Colleagues with access: With Power Apps for Teams, you can share an app with Azure AD security group whose members need not be part of the Teams team where the app was built. This enables you to add users to the application without having to add them to the specific team, and opens up “Broad Distribution” scenarios. For example, you may want to build an app that is enabled for every accountant in the organization, or even every employee in that organization. https://learn.microsoft.com/en-us/power-apps/teams/dataverse-for-teams-table-permissions

upvoted 2 times

Jons123son 3 years, 5 months ago

It has to be D Again one of those questions that are absolutely unclear about the goal. Do users require access to the app, do users want to add the app from the store? Who are the users... Anyway, C does not give access to the app. Teams Admins, Teams App Admin or tenant admin could Pin an app to the bar or via a policy for groups, users, or all users. Before that, they would have to upload the app in the developer portal, publish it for approval and finally approve the app, which would add it to the store. But this only allows to install the app. It does not give access to the app automatically. Owners have still to share the app with users or groups. If the app has not been shared, users will get the usual access denied screen. I have been there. Also we are talking about a Dataverse for teams environment. You can share a Power Apps build in a team only with a single M365 or security group, not with individuals.Also you can only share using Power Apps in Teams, not from the maker portal.

upvoted 2 times

fariasalan86 3 years, 6 months ago

The question doesn't make it clear if it's for a user, a group, or everyone. Even so, I think you would need to ask a tenant admin to pin the app to the app bar in Teams. I explain: To make a Power Apps app for Microsoft Teams created with Microsoft Dataverse for Teams accessible to users, it must

be added to the app bar in Teams, which can only be done by a tenant administrator. Therefore, you should request that the administrator pin the app to the app bar. Although sharing the app with a security group using the Maker portal (A) or Teams (B) would allow members of that group to access the app, they would still need to locate and open it.

klnv000 2 years, 7 months ago

Answer: 5,6,7Also for ChatGpt: To add the app to Teams, you should perform the following actions in sequence: - Sign into the Maker portal for Microsoft Power Platform (Action 5) - Select the required Power Apps app (Action 6) - Add the app to Teams (Action 7) These steps will ensure that the app is properly added to Teams for your employees to use. Please note that only those with the necessary permissions will be able to perform these actions. If you encounter any issues, please refer to the official Microsoft documentation or contact your IT department for further assistance.

Question #36 *Topic 2*

HOTSPOT

-

A company creates a Microsoft Teams app that stores data in two tables in a Microsoft Dataverse for Teams environment.

Users require access to the app and the app data.

You need to configure access.

What should you do? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

I think that the answer is correct : https://learn.microsoft.com/en-us/power-apps/teams/set-perms-and-shareaccording to this link it is correct: "Assign the colleagues with access role to a security group and share the app" but then 1st box looks like 1st option --> "After you've completed setting the permissions to all your tables, you're now ready to share the app with an existing security group"
